specifications are subject to change without notice. This information and any copies produced electronically or otherwise must be surrendered upon demand of Fender Musical Instruments Corporation.

- Parts marked with two asterisks (**) indicate the required use of that specific part. This is necessary for RELIABILITY and SAFETY requirements. **DO NOT USE A SUBSTITUTE!**

PARTS LIST CODES

The description codes used in the itemized Parts Lists are defined below:

CAPACITOR CODES

CAP AE	=	Aluminum Electrolytic
CAP CA	=	Ceramic Axial
CAP CD	=	Ceramic Disk
CAP MPF	=	Metalized Polyester Film
CAP MY	=	Mylar
CAP PFF	=	Polyester Film/Foil

RESISTOR CODES

RES CC	=	Carbon Comp
RES CF	=	Carbon Film
RES FP	=	Flame Proof
RES MF	=	Metal Film
RES WW	=	Wire Wound

HARDWARE CODES

BLX	=	Black Oxide
CR	=	Chrome Plated
HWH	=	Hex Washer Head
M	=	Machine Screw
NI	=	Nickel Plated
OHP	=	Oval Head Phillips
PB	=	Particle Board
PHP	=	Pan Head Phillips
PHPS	=	Pan Head Phillips Sems
SMA	=	Sheet Metal "A" Point
SMB	=	Sheet Metal "B" Point
SS	=	Stainless Steel
TF	=	Thread Forming
ZI	=	Zinc Plated

STAGE® 100/160 DSP

(This is the model name for warranty claims)

SERVICE NOTES

- 1. CHASSIS REMOVAL** is accomplished by first removing two (2) screws from the cabinet side panel and four (4) screws from the top of the cabinet; disconnect the ¼" speaker plug(s) from the speaker jack(s) and then slide the chassis toward the rear of the cabinet.
- 2. uDSP PCB ASSEMBLY REMOVAL** is accomplished by disconnecting the ribbon cable on the PCB Assembly, releasing the tabs on each of the plastic stand-offs which the PCB assembly is mounted. Removal of the uDSP PCB assembly may be necessary should any of the Digital Effects operate improperly.
- 3. STAGE 100/160 DSP MAIN PCB REMOVAL** is accomplished by removing the following items: All knobs including washers and nuts (14) , one (1) input jack nut and washer, (1) screw near mains fuse, seven (7) screws at the heatsink attached from the bottom of the chassis. Disconnect the transformer and primary leads at P1-P14. Disconnect the breakaway PCB ribbon cable at P20 and speaker wires (blk/wht) at P15-P16. Disconnect the ribbon cable to uDSP assembly at P19. Remove the power LED from the jewel assembly.
- 4. STAGE 100/160 DSP BREAKAWAY PCB REMOVAL** is accomplished by removing five (5) nuts and washers at the jacks and two (2) screws at the XLR jack. Disconnect the ribbon cable from the main PCB at P20 and the speaker wires (blk/wht) at P15-P16.

PCB EXCHANGE POLICY

Parts marked with a single asterisk (*) in the Part Lists (starting on page 10) are not field replaceable. If a failure due to one of these components is detected, please contact the Fender® Dealer

Customer Service Department to order the complete PCB Assembly.

STAGE® 100/160 DSP

(This is the model name for warranty claims)

CIRCUIT DESCRIPTION

This section provides an overview of any new or unusual circuitry incorporated into this amplifier model. The purpose is to aid the service technician by providing insight into the design areas most likely to present a challenge in troubleshooting. This overview is focused for the efficient use and security of Fender® proprietary information.

PRE-AMPLIFIER

The guitar input signal is fed into the high pass filter at U1-A before splitting into two signal paths. The normal channel signal path (U1-B to U3-B) is active until FETs Q2, Q4, and Q6 are turned on activating the drive channel signal path (U2-A to U3-B). Turning on FETs Q1, Q3, and Q5 activates the “More Drive” channel signal path for increased gain and sustain. Differential amp U8-A and follower U8-B adjust the signal level and provides +1.65VDC bias voltage to the uDSP effects card. The preamp is in series with the digital effects card, therefore, disconnecting the card breaks the overall signal path. The low pass filter at U5-B recovers the signal from the uDSP card and sends it to the external effects loop and power amplifier.

POWER AMPLIFIER

“Flying Rail” power amp topology. The output stage is referenced to ground, and the output signal is derived from the center tap of the high voltage power supply (C86 & C87) which is floating. Diff-amp U7-B amplifies voltage developed at the load sense resistors (R120–123) to provide negative current feedback. Inserting an 8Ω load at Ext. Spkr (J7) turns on FET Q20 creating an attenuation network (R117–119) to compensate for the increased current at 4Ω total load impedance. This allows the amplifier to have a similar frequency response running either an 8 or 4Ω speaker load.

Thermistor RT2 monitors the heatsink temperature. Its resistance increases with temperature and at approx. 100 °C turns on xstr Q23. This shorts out C77, turning on FET Q22 providing a muting function at the power amp input. The amplifier remains muted until the heatsink cools down, at which point, normal operation is restored.

POWER SUPPLY

Standard bridge rectifiers for both high and low voltage sections, with zener regulation (D52–53) for the +/-16V supplies. Half-wave rectifier (D46–47, C48) supplies U11, 7805 regulator for +5V supply for the uDSP card and digital user-interface.

DIGITAL USER INTERFACE

The uDSP effects card generates clock signals HD0 (~45Hz) and HD1 (~90Hz) which control the 4053 CMOS switch to read pots R134, R135, and R138. The DC level (0–5V) of the pots controls the reverb level, fx level, and fx time/rate. Power (+3.3V) is switched to encoders S4 and S5 via the 4053, also controlled by HD0. The outputs of the 4-bit encoders, isolated by diodes D28–D35, determine the active reverb and fx algorithms (HD4–HD7).

DIGITAL NOISE

The uDSP effects card generates some high frequency noise (>50kHz), which is a normal product of DSP processing. This noise is not audible and does not effect amplifier performance, but may be visible when observing the output of the amplifier on an oscilloscope.
