ALIGNMENT PROCEDURE

CONNECT JUMPER FROM
BYPASS GND TO FRONT OUTPUT
GND FOR TEST PURPOSES

DEMODULATION CIRCUIT

The following adjustment sets the center frequency of the demodulation phase locked loop to 30kHz:

If a frequency counter is available:

1. Set the function switch to the "bypass" position and connect the counter to Pin 17 and Ground (Pin 3).
2. Connect power and turn the unit ON. Allow a 5 minute warm-up time.
3. Adjust VR1105 to obtain a free running frequency of 30.0kHz.
4. Disconnect power and remove measuring equipment.

In the absence of a counter, an accurate source of 30kHz signal at a level of 1-2mV is required, or a CD-4 record may be used, according to the following procedure:

1. Connect a clip lead from Pin 13 of either board to Ground (Pin 3).
2. Connect a 100uf capacitor from Pin 2 to Ground (Pin 3). If a polarized capacitor is used, the positive lead is connected to Pin 2.
3. Turn the "CD- Separation" controls fully counterclockwise.
4. Set the Function switch to "CD-4" position.
5. Connect the signal generator or a turntable with a CD-4 cartridge and record to the input.
6. Connect the output of the channel to be adjusted to an amplifier which can be used for listening.
7. Connect power (to both units) and turn them ON. Allow 44+ to warm-up for 5 minutes.
8. Set the signal generator to 30kHz at 1-2mV or place the tone arm on the record in an area where an unmodulated subcarrier exists, such as the space between selections. It is essential that an *unmodulated* signal be used.
9. Adjust the volume so that a beat note can be heard.

NOTE: A beat may not be heard if VR1105 is already adjusted for zero beat or if the beat is out of the audible range. If a beat is not heard when rocking VR1105 through its extremes, there is a problem with the unit or the test setup.

10. Adjust VR1105 for zero beat.

NOTE: Within a small range of this adjustment the beat will disappear. This is due to the phase locked loop locking to the input. Set VR1105 to the approximate center of this range.

11. Disconnect power and remove the added components and jumpers.
12. Repeat this procedure for the other CD-4 board.

NOTE: L1101 is factory set and need not be adjusted. If it is misadjusted by mistake, the core may be set flush with the top of the form.

ANRS ALIGNMENT PROCEDURE

This procedure must be performed if any components in the ANRS are replaced.

1. Cut the Jumper "J2" and remove the insulation from the pieces.
2. Connect an audio oscillator through an attenuator and a 10uF, 25 volt capacitor to the piece of the jumper nearest to the input (Pin 4). The positive lead of the capacitor connects to the CD-4 board.
3. Connect a clip lead from Pin 13 of either CD-4 board to Ground.
4. Place the function switch in the "bypass" position.
5. Connect power to the unit and turn in ON. Allow it to warm-up at least 1 minute.
6. Set the ANRS controls as follows: VR1101, 1102 at center, VR1103 fully clockwise, VR1104 fully counterclockwise.
7. Set the frequency of the oscillator to 30Hz and the level to 320mV (-8dBm) and observe the output level at Pin 9. It should be 210mV (-11.5dBm) ± 2 dB.

This level is a reference to which the following readings are compared:

Step No.	Frequency	Set Level To	Adjust	To Obtain at Tape Output
8.	4kHz	300mV (-1dB)	4kHz GAIN VR1102	-1 ± 1 dB
9.	4kHz	68mV (-13dB)	4kHz LAW VR1104	-21 ± 1 dB
10.	Repeat 8 & 9 until no further improvement is noticed.			
11.	4kHz	130mV (-8dB)	Check	-11 ± 1 dB
12.	4kHz	32mV (-20dB)	Check	-32 ± 2 dB
13.	If 11 & 12 are not within limits, return to Step 8.			
14.	630Hz	78mV (-12dB)	630 LAW VR1103	-20 ± 1 dB
15.	630Hz	350mV (+1dB)	630 GAIN VR1101	0 ± 1 dB
16.	Repeat 14 & 15 until no further improvement is noticed.			
17.	630Hz	160mV (-6dB)	Check	-10 ± 1 dB
18.	630Hz	35mV (-19dB)	Check	-30 ± 2 dB
19.	Repeat steps 8 through 17 until no further improvement is noticed.			
20.	Disconnect power and oscillator.			
21.	Remove the clip lead from Pin 13 to Ground.			
22.	Reconnect the Jumper at J2.

NOTE: To speed handling of your order be sure to include both the model and serial numbers which appear at the back of the chassis, in addition to the quantity, part number and part description of the items ordered. Orders from independent dealers, independent servicemen, and retail customers will be shipped on a cash in advance basis. Harman-Kardon reserves the right to substitute equivalent parts for those originally installed in this chassis. All parts should be ordered from Harman-Kardon, 55 Ames Court, Plainview, L.I., N.Y. 11803, Att: Parts Department.

TEST SPECIFICATIONS

The following test specifications are to be used as a guide and indicate satisfactory performance within established quality control limits.

All measurements are taken at 120 volts AC line.

SPECIFICATIONS	TEST CONDITIONS	TEST SPECIFICATIONS
1. Sensitivity — main channels	1 kHz, separation pots set for max. gain 2 mV input, 30 kHz carrier on, no deviation main channels. . .	.775 V $\pm$ 2 dB at output
— with sub-channel	2mV at 1 kHz 2mV at 30 kHz 1.25 kHz deviation of subcarrier, set separation pots for max. separation 40 microsecond delay	.4 V $\pm$ 2 dB at output
2. Channel separation	100%, 1 channel only modulated, -50 dBm input 40 microsecond delay 300—1200 Hz	20 dB
3. Signal-to-noise ratio —main channel	CD-4 defeated bandwidth 5 Hz — 15 kHz 0 dB=.775 V RMS reference	60 dB
—sub channel	CD-4 enabled input = 2 mV at 30 kHz bandwidth = 5 Hz to 15 kHz	55 dB
