LEAKAGE TEST (FOR SERVICE ENGINEERS IN THE U.S.A.)

Before returning the unit to the user, perform the following safety checks:

- 1. Inspect all lead dress to make certain that leads are not pinched or that hardware is not lodged between the chassis and other metal parts in the unit.
- 2. Be sure that any protective devices such as nonmetallic control knobs, insulating fishpapers, cabinet backs, adjustment and compartment covers or shields, isolation resistor-capacity networks, mechanical insulators, etc. which were removed for servicing are properly reinstalled.
- 3. Be sure that no shock hazard exists; check for leakage current using Simpson Model 229 Leakage Tester, standard equipment item No. 21641, RCA Model WT540A or use alternate method as follows:
Plug the power cord directly into a 120-volt AC receptacle (do not use an Isolation Transformer for this test). Using two clip leads, connect a 1500 Ohm, 10-watt resistor paralleled by a 0.15 μF capacitor, in series with all exposed metal cabinet parts and a known earth ground, such as a water pipe or conduit. Use a VTVM or VOM with 1000 Ohms per volt, or higher sensitivity to measure the AC voltage drop across the resistor. (See Diagram.) Move the resistor connection to each exposed metal part having a return path to the chassis (antenna, metal, cabinet, screw heads, knobs and control shafts, escutcheon, etc.) and measure the AC voltage drop across the resistor. (This test should be performed with the power switch in both the On and Off positions.)

A reading of 0.35 volt RMS or more is excessive and indicates a potential shock hazard which must be corrected before returning the unit to the owner.

ALIGNMENT PROCEDURES (REFER TO PAGES 17 THROUGH 25 AND 37 THROUGH 40)

1. DC BALANCE ADJUSTMENT

- a) Set the Speaker Operating Mode switch for both L and R channels to the 4Ω position.
- b) Allow 20 minutes' aging.
- c) Connect a Digital Voltmeter to the speaker terminal and adjust VR401 (L ch) and VR402 (R ch) so that $\pm 0\text{mV}$ DC voltage is obtained.
- d) Set the Speaker Operating Mode switch for both L and R channels to the 8Ω position.
- e) Allow 10 minutes' aging.
- f) Connect a Digital Voltmeter to the speaker terminal and check to make sure that DC voltage is $\pm 60\text{mV}$.

2. IDLING CURRENT ADJUSTMENT

- a) Connect a 100Ω resistance as shown in the figure and adjust VR403 (L ch) and VR404 (R ch) so that TP1-to-TP2 voltage and TP3-to-TP4 voltage add up to $32\text{mV} \pm 3\text{mV}$.
- b) After adjusting the idling current, check again to ensure that the DC balance is properly maintained.

CIRCUIT DESCRIPTION

● Protection circuit by thermistors PT1 and PT2

As the temperature of the thermistors (PT1 and PT2) installed to the heat sink rises, their resistance reduces. Then Q8 turns OFF followed by Q7, Q6 and Q1 which all turn OFF, while Q2 and Q3 turn ON. As the level of Q3 collector becomes LOW in this state, Q401, Q417 (L ch) and Q402, Q418 (R ch) turn ON to mute the input signal. When in the monaural mode, the R ch is muted by Q87 and Q418.

● Remote power ON/OFF

During stand-by, the input of the remote power is kept at LOW level, so HIGH level input is entered into 7 pin

(SET) of Flip-Flop IC201 and LOW level input into 4 pin (RESET), making the level of 1 pin (Q) HIGH. And this causes Q202 to turn ON and LED's D204 and D205 to light.

When HIGH level input is entered into the input of the remote power in this state, Q201 turns ON, the level of 7 pin (SET) becomes LOW and that of 4 pin (RESET) becomes HIGH. This then makes the level of 1 pin (Q) LOW and Q202 turn OFF. As a result, the LED turns OFF. As the same time the level of 2 pin (Q) becomes HIGH and Q204 turns ON, making the relay to operate to supply power to the amplifiers of both L ch and R ch.

POWER CORD REPLACEMENT (FOR SERVICE ENGINEERS OTHER THAN NORTH AMERICA)
