RX SECTION

Signals from the antenna are applied to the FINAL unit (X60-1280-XX) transmit receive swithing circuit, D2 and D4. In receive, diodes D2 and D4 are reverse biased forcing the incoming receive signal down thru L3 to the RA (Receive Antenna) terminal. There the incoming receive signal is then coupled to the COMPOUND Unit (X60-1280-XX). The signal is filtered by a low pass filter and amplified by Q1 the first RF amplifier, a GaAs FET : 3SK129(S). The amplified RF signal is then mixed with the LR (Receiver Local Oscillator) signal in the first mixer Q2 : 3SK74(L) to obtain the First IF frequency of 10.695MHz. This IF signal is filtered by Helical Resonator, L4, and a two stage MCF (Monolithic Crystal Filter), L8, which combine to provide excellent two-signal characteristics and sensitivity.

The First IF signal from the MCF is then amplified by the First IF amplifier Q3 : 2SC2668(Y) and applied to the FM IF Amplifier/Mixer/Detector, IC2 : TA7761P. This signal IC mixes the IF signal with the 10.24MHz 2nd Local Oscillator signal (L14) to obtain the 2nd IF frequency of 455kHz, then amplifies, routes the signal thru external filter L16, and finally convertes it into the received audio signal with the internal quadrature detector. The 2nd Local Oscillator signal from L14 and IC2 is also used by the PLL unit as a Reference signal.

The detected audio output from IC2 is applied to the SQUELCH CONTROL (X59-1040-10), and to the de-emphasis circuit R56 and C99. The (de-emphasized) audio is amplified by Audio preamplifier Q9 : 2SC2458(Y) and then applied thru the AF GAIN control to the Audio Amplifier IC1 : μ PC1241H which drives the speaker.

The noise component of the detected audio is filtered by a band-pass filter, in order to obtain a frequency of approximately 30kHz (which is well outside the normal voice bandwidth) and then amplified by the noise amplifiers contained inside IC2. This amplified noise is rectified by diodes D6 and D5 and applied to Q1 of the Squelch Switch. Q1 is used to control the conduction of Q2, which controls AF Preamp Q9.

A center-stop tuning circuit is provided to ensure that the incoming signal is actually on frequency before the squelch is opened. A portion of the 455kHz IF signal is coupled thru the secondary of L17 and applied to CENTER STOP unit (X59-1030-10) where Ceramic Discriminator L12, and Window comparator IC1 : NJM4558M are used to determine if the incoming signal is actually the channel center. When the detected signal applied to the window comparator reaches a predetermined level, Q5 of the Squelch Switch will be turned OFF or ON. The Squelch Switch determines if there is an incoming signal at the same time. If the incoming signal is at the proper level, and on frequency, the squelch will open and the C.TUNE indicator in the LCD display will turn ON. This indicator is controlled by IC2, the main microprocessor on the CONTROL unit (X53-1440-XX), thru inputs supplied from the COMPOUND unit via the BD line. During Open Channel Scanning of the DCL system Q3, Q1, and Q2 of the Squelch Switch are controlled by the main microprocessor via the SQS line. During DCL operations open channel search threshold levels are controlled by VR3 of the Compound ass'y. Transistor Q6 of the Squelch Switch, is used to prevent the Center Stop circuit from activating during Open Channel Scan Operation.

Note 1 :

The Center Stop circuit is not activated during Open Channel Scan.

Fig. 1

Audio Preamplifier Q9 is controlled by Q1 of the Alert, Vacant CH. unit (X59-1020-10) during Alert, code Squelch and Open Channel operations.

TX SECTION

Incoming microphone audio from the DISPLAY unit (X54-1860-10 C/3) is amplified by Q8 : 2SC1775(E). This amplified audio is then buffered by buffer amplifier Q7 : 2SC2458(Y) and applied to D2 : 1SS181 of the MIC AMP/S METER unit (X59-1010-10) for limiting. The signal is then amplified by a portion of IC1 : NJM4558M on the MIC AMP/S METER unit. D2 of the MIC AMP unit (X59-1000-10) provides additional limiting. The microphone audio is filtered by a 2 stage active LPF, IC1 : NJM4558M and applied to varactor diode D3 : 1S2208 in the PLL unit (X50-2030-XX) for phase modulation of the transmit VCO, Q8.

The phase-modulated FM signal is amplified by driver transistors Q10 : 2SC2688(Y), Q11 : 2SC2347 and Q12 : 2SC2538-22-A (TM-2530) or 2SC3019 (TM-2550) and applied to the FINAL unit (X45-1440-10 : TM-2550A/E or X45-1440-11 : TM-2530A).

This signal is amplified by the Hybrid Final Amplifier Module Q1 : M57737 (TM-2530A) or M57726 (TM-2550A/E) and applied to the antenna via the transmit/receive switching diode D2. During transmit, forward bias is applied to D2 allowing the transmit signal to pass. Diode D3 is also forward biased during transmit. The value of L3 was selected to present a high impedance to the transmitted signal. Any of the transmit signal that passes thru L3 is shunted to ground thru D3 to protect the receiver circuits and prevent feedback. Once the signal has been passed thru D2 it proceeds thru the LPF and to the antenna.

The APC (Automatic Protection Circuit) on the FINAL unit consists of two circuit, a negative feedback circuit that senses output power and an SWR protection circuit.

CIRCUIT DESCRIPTION

The negative feedback circuit samples the transmitted signal, rectifies this signal with D4, and applies the rectified signal to NF GAIN amplifier Q6 : 2SC2458(Y). This amplifier supplies a signal to Differential Amplifiers Q4 and Q5 : 2SC2458(Y) which control the bias applied to the PA module pin 2, and driver transistor Q12 of the PLL unit, via bias regulators Q2 : 2SD1406(Y) and Q3 : 2SA1015(Y). High/Low power switching is accomplished by applying a ground to pin number 1 of connector (2) on the FINAL unit. This causes VR3 to act as a voltage divider that controls the conduction of NF GAIN amplifier Q6.

Reflected power is coupled thru D5 on the FINAL unit and is used to control the conduction of Q7. This transistor function like Q6 to control differential amplifiers Q4 and Q5, and thus the bias applied to the Power Amplifier.

Fig. 4 M57737 Equivalent circuit

PLL CIRCUIT

The PLL circuit is divided into two main loops : transmit and receive.

Receive PLL Loop

The signal generated by the RX VCO (Voltage Controlled Oscillator) Q16 : 2SK192A(GR)*P is applied to buffer amplifier Q17 : 2SC2668(Y) and mixed with the HET (Heterodyne) signal by Q21 : 2SC2668(Y) where it becomes the PLL IF signal (K,M 13.015 to 15.010MHz, T,W 12.865 to 19.86MHz). This PLL IF signal is then amplified by Q20 : 2SC2668(Y) and applied to the Phase Detector IC2 : MC145155P*K where it is divided to obtain a 5kHz signal. The divide ratio is determined by Serial Data from the CONTROL unit. This 5kHz signal is compared with the 5kHz reference signal obtained by dividing the 10.240 MHz Reference signal.

The Phase Detector compares the phase of these two signals and transmits an error control signal to the VCO. The control signal is filtered by an Active Low Pass filter composed of Q13 : 2SK30A(O) and Q14 : 2SC2458(Y) to remove any AC fluctuations to obtain a DC correction voltage. The correction voltage is used to change the capacitance of Varactor Diode D5 : 1SV50, which varies the output of the RX VCO to lock it on frequency.

If the phase difference is too great to be corrected by the control voltage applied to D5, an unlock signal is generated by the Phase Detector. This signal turns OFF Q15 : 2SC2458(Y) which turns OFF output amplifier Q18 : 2SC2668(Y) to prevent operation outside the authorized limits.

The PLL HET Oscillator, Q19 : 2SC2668(Y) oscillates at 39.48MHz. This signal is applied to frequency tripler Q22 : 2SC2668(Y) to obtain a signal of 118.44MHz which is applied to mixer Q21.

Item	Symbol	Tc (°C)	Rating

CIRCUIT DESECRPTION

Transmit PLL Loop

The signal generated by the TX VCO Q8 : 2SK125 (K,M 142.00 to 148.995MHz, T,W 144.00 to 145.995MHz) is mixed with the RX PLL output, by Q7 : 2SC2688(Y) and applied to the Transmit Phase Detector IC1 : MC145151P. This signal and the 10.240MHz signal from IC2 are divided by 512, to obtain 20kHz. These two signals are compared and an error correction signal is applied to the Active Low Pass filter Q3, Q4 and Q5 : 2SC1775(E). Comparison at a frequency of 20kHz provides shorter response times, a real necessity in transmit. The DC correction voltage from the LPF is used to control varactor diode D2 : 1SV50.

The divide ratio is increased by 91 during transmit operations. This causes the TX VCO frequency to be locked at a frequency 455kHz higher than the RX VCO frequency which prevents internal mixing. When an error occurs that is greater than the correction voltage limits an unlock signal is generated by IC1. This signal controls the conduction of Q1 : 2SC2458(Y) which controls Q2 : 2SA1048(Y) to stop transmissions. Q2 interrupts the bias of the TX driver stage.

CIRCUIT DESCRIPTION

CONTROL UNIT (X53-1440-XX)

The CONTROL unit uses two Microprocessors. the Main Microprocessor IC2 : TMP47C46N-9042 and Auxilliary Microprocessor IC3 : μ PD75008HC-056. Both utilize 4 bit architecture and have 4K Bytes of ROM available.

The Main Microprocessor controls; frequency, offset, tone, memory frequency, key, switch, encoder, frequency display, DCL system and the Auxilliary Microprocessor. The Auxilliary Microprocessor controls; the voice synthesizer, display/contrl/and memory for telephone number functions, tone frequencies (K,M), audio oscillator, and digital signal conversion and analysis processing for DCL system.

The Main Microprocessor utilizes a serial interface bus to the Auxilliary processor. A CMOS static RAM, IC6 : TC5047AP-1 with a capacity of 1K x 4 bits, is used for external memory storage of operator programmed data such as memory frequencies and telephone number data. It also functions as a data buffer when exchanging data between the Main and Auxilliary processors. Memory addressing is performed by IC5 : TC40H374P with read and write operations being handled by the Data Bus.

Switch Section

With a few exceptions most switch inputs on the front panel are arranged in a diode matrix. The Main Microprocessor reads the inputs via a keyboard status scan system. This system determines which key, if any, has been depressed.

The diode matrix is illustrated in Fig. 10.

The PHONE switch (K,M), P.MR switch (T,W) TONE switch, PTT switch, UP switch and DOWN switch all supply inputs directly to the Main Microprocessor.

Keyboard section

Fig. 11 illustrates the keyboard section circuit diagram. The keyboard receives scan pulses from the Main Microprocessor ports P10 thru P13. The current keyboard status is returned via ports R70 thru R73. Pull-up resistors of P10 thru P13 are controlled by port R90. Keyboard status is scanned when R90 is pulled up from logic low by Q3 : DTA114YF.

Display section

Fig. 11 shows the layout of the LCD.

The LCD driver (Keyboard ass'y) is controlled via 8 data lines and 4 control lines on a parallel bus system by the Main and Auxilliary microprocessors.

Data transfer is possible only when the CS line is Low and in conjunction with the leading edge of the WE pulse. The DCL and CQS LED's are lit by transistors Q4 and Q5 which are controlled by the Main Microprocessor.

Fig. 10 Diode matrix

CIRCUIT DESESCRIPTION

Fig. 11 Keyboard section circuit diagram

CIRCUIT DESCRIPTION

DTMF circuit (K,M Type)

The DTMF (Dual Tone Multiple Frequency) signal is generated by IC4 : LR4087 on the CONTROL unit. Power for the tone generator is obtained from the 8T (8 volts on transmit) line. During receive the IC is grounded preventing unwanted tone generation.

During transmit the non-exclusive port R90 is a logic High, causing pull-up resistors P10 thru P13 to open allowing the DTMF signals to be generated by pressing one of the keyboard keys.

During automatic transmission of telephone number information port R90 is a logic Low, connecting pull-up resistors P10 thru P13. P10 thru P13 apply a logic High, and P70 thru P73 a logic low, so that the desired DTMF signals are generated. While the DTMF signal is being generated IC4 (CONTROL unit) mutes the normal transmitted audio.

Fig. 12 DTMF circuit

Fig. 13 LR4087 Block diagram (Control unit IC4) K, M type only

CIRCUIT DESCRIPTION

PLL and Tone data (K,M type)

PLL and Tone data are sent from the Main Microprocessor on P30 and the Clock signal is on P33. Data and Clock signals are used concurrently. The Enable signal is transmitted on P21 for PLL data and on RC3 for tone data.

Audio Oscillator (CONTROL unit)

An audible confirmation of various keyboard inputs is provided by the TM-2530/50. This audio output is controlled via line P21 of the Auxilliary Microprocessor, IC3. The Oscillator is a portion of IC1 : MC14584BCP and its output is supplied to the COMPOUND unit via the BZ line.

Voice Synthesizer Control Section

The Main Microprocessor (IC2) analyzes inputs from the VOICE unit, and provides control information to the Auxilliary Microprocessor (IC3) necessary for processing the Voice data.

The Auxilliary Microprocessor provides control input and output via data lines PS0 thru PS4, SR and BY.

Rotary Encoder Section

Fig. 14 shows the encoder output waveforms. Waveform B is used as a reference. The phase of waveform A is compared with that of waveform B to determine if the dial base been turned clockwise or counterclockwise. A portion of IC1 is used as a Schmitt trigger to filter out any chattering of the encoder contacts. The inverted waveforms from IC1 are applied to the Main Microprocessor on pins RP0 and RP1, where the phase of the waveforms is compared. the number of input pulses is also counted by the microprocessor to determine how much of a frequency change has been ordered.

Fig. 14 Encoder output waveforms

Other Input and Output Sections

1) Standby or push-to-talk

PTT switch status is sent to the Main Microprocessor via the SS terminal on PS1. During manual or automatic transmission a logic Low is supplied on the RA2 line to the COMPOUND unit. This signal turns on the transmit voltage regulator and turns OFF the receive voltage regulator.

2) Microphone UP/DOWN switches

Any switch chattering (Keyboard) is filtered by C11 and C12 and the inputs from the UP and DOWN switch are applied to the Main Microprocessor on pins RB3 and RB2 for processing.

3) Busy indicator (BD)

A signal is supplied from the COMPOUND unit Center Tune circuit to the Main Microprocessor via pin RB2 to indicate when the radio has received an input and squelch has opened.

4) Microphone Muting

In order to prevent interference to the Digital signals transmitted when using the DCL system the microphone must be muted. This function is controlled by Auxilliary Microprocessor via pin P61.

5) Squelch Switch (SC)

The Main Microprocessor provides a signal to control the Squelch threshold level during Digital Channel Linkage operations. Specifically this occurs when the radio is scanning for an open channel. When the SC terminal is a logic low, VR3 of the COMPOUND unit is used to control the Squelch Threshold.

6) RX Audio Muting (AL)

The Main Microprocessor provides a logic High on P32 to mute the receive audio during Code Squelch operation, Open Channel search operations, and Priority channel scanning.

CIRCUIT DESCRIPTION

Resetting the Microprocessor

To reset the Main Microprocessor (return to the default settings) ground pin number 49 of the Main Microprocessor. This should normally only be required when replacing the Lithium battery.

The Auxilliary microprocessor is reset by a reset pulse from IC7 : PST520D.

NOTE 2 : The operating system of this radio is in NON-ERASEABLE memory in the microprocessors. Replacing/removing the battery will not require reprogramming of Operating System parameters. Operator programmed information (telephone numbers, memory frequencies, etc.) will require reentry.

Memory backup

Transistor Q2 : 2SC2458(Y) and zener diode D3 : MTZ7.5JA sense when the voltage supplied to the DC power connector drops below approximately 7.5 Vdc from its normal 13.8 Vdc. If the supply voltage falls below this minimum a control signal is supplied to the HOLD terminal (pin 52) of the Main Microprocessor via a Schmitt trigger. The microprocessor then enters the backup mode and draws power from the Lithium battery.

Fig. 15 Reset circuit and waveforms at respective points

DCL Contro System

A block diagram of the DCL control system is shown in Fig. 16

Control of Open Channel searching is performed by the Main Microprocessor. The microprocessor searches for an open channel by controlling the frequency of the receiver section. When an open channel is found the frequency data of that channel is stored into RAM and a control signal is applied to the Auxilliary microprocessor. The Auxilliary microprocessor takes this signal, reads the frequency data that was stored in the RAM, generates the Digital Control signal, and applies this data to the MODEM unit (X57-1140-20). The MODEM unit uses this incoming data to generate the MSK (Minimum Shift Keying) signal which is applied to the COMPOUND unit for transmission.

A portion of the incoming receive signal is applied to the RD terminal of the MODEM unit. The MODEM unit detects the prescence of any Digital Control signal and if present relays it to the Auxilliary Microprocessor.

The Auxilliary microprocessor compares the incoming DCL signal with the preprogrammed DCL data maintained in memory. If the signals are equal a request is made to transfer the incoming data into RAM. The Main microprocessor detects this transfer request and passes the data into RAM, and transmits a signal signifying data has been received, it sounds an audible alarm.

The Main microprocessor performs any frequency shifts or code squelch functions, determined by the incoming data.

Table 8 μPD7508H-056 Terminal functions (Control unit IC3)

CIRCUIT DESECRPTION

TONE unit (X52-1330-20)

Incoming serial data from the Control unit is converted to parallel data by IC2 : MB88306. Serial data on the DT line, and the serial clock is on the CT line. When the ET terminal is high data is transferred, the tone output can be disabled by setting D1 to logic low. This can also be done by switching the ME terminal high.

IC1 : S7116A prevents the tone generator from oscillating outside the specified limits.

MODEM unit (X57-1140-20)

The modem Q3 : μ PD65003C-20 uses a clock frequency of 3.6864MHz that is supplied across pins 18 and 19. Pin 13 is used to select transmit or receive operation of the modem. Transmit is selected when pin 13 is high, and receive when it is low. Pin 12 supplies the modem clock (1200Hz) to the MC terminal for transmit and receive clock timing purposes. Data transfers are based on this clock timing. When the transmit mode has been selected data is transferred to pins 1 thru 5 to produce the 1200 or 1800Hz MSK signal. This signal is then digital to analog converted by a ladder resistor network and applied to the TD terminal.

When the MODEM unit is in the receive mode it processes the signal applied to pin 9. This digitized Audio Frequency signal is received from the RD terminal after passing thru a band-pass filter and comparator circuit. This signal is converted by the MODEM unit and transferred thru pin 7, shaped by the LPF and comparator and applied again to pin 8.

The receive data and clock signal that are generated by the modem are based on the data applied to pins 12 and 14.

Fig. 17 MODEM unit (X57-1140-20) block diagram

Fig. 18 MB3756 Equivalent circuit (COMP unit IC3)

CIRCUIT DESESCRIPTION

Fig. 19 IR2429 Block diagram (Display unit IC1)

Pin No.	Pin Name	I/O	Pull U/D	Part Name	Pin No.	Pin Name	I/O	Pull U/D	Remarks
3	S10	O	—	LCD	10				Level meter segment output
5	S8				8				
7	S6				6				
8	S5				5				
9	S4				4				
10	S3				3				
11	S2				2				
12	S1				1				
15	BIAS		—						Prevents C12 oscillation
16	C		—	GND					External clock is used; C is grounded.
18	VCC	I	—	Connector J6	8C2	I			8V power supply
19	VREF—MAX								Determines level 10 voltage value.
20	VREF—MIN			GND		I			Determines level 1 voltage value.
21	VIN		D R21	Connector J6	M	I			Meter input (DC)
22	GND	—	—	GND					GND pin

Note: Pins not specified must remain open.

DISASSEMBLY

Parts with the exploded numbers larger than 700 are not supplied.

ADJUSTMENT

REQUIRED TEST EQUIPMENT

1. DC V.M
- 1) High input impedance
2. RF VTVM (RF V.M)
- 1) Input impedance : 1MΩ min., 2pF max.
- 2) Voltage range : F.S = 10mV ~ 300V
- 3) Frequency range : Up to 150MHz
3. Frequency Counter (f. counter)
- 1) Input sensitivity : Approx. 50mV
- 2) Frequency range : Up to 150MHz
4. DC Power Supply
- 1) Voltage : 10V ~ 17V, variable
- 2) Current : 8A min.
5. RF Power Meter
- 1) Measurement range Approx. : 50W
- 2) Input impedance : 50Ω
- 3) Frequency range : 144MHz
6. AF VTVM (AF V.M)
- 1) Input impedance : 1MΩ min.
- 2) Voltage range : F.S = 1mV ~ 30V
- 3) Frequency range : 50Hz ~ 10kHz
7. AF Generator (AG)
- 1) Output frequency : 100Hz ~ 10kHz
- 2) Output voltage : 0.5mV ~ 1V
8. Linear Detector
- 1) Frequency range : 144MHz
9. Field Strength Meter
- 1) Frequency range : 144MHz
10. Directional Coupler
11. Oscilloscope
- 1) High sensitivity oscilloscope with horizontal input terminal
12. SSG
- 1) Frequency range : 144~149MHz
- 2) Modulation : AM and FM MOD.
- 3) Output level : -20dB to 100dB
13. Dummy Load
- 1) 8Ω, 5W (approx.)
14. Noise Generator
- 1) Must generate ignition-like noise containing harmonics beyond 150MHz.
15. Sweep Generator
- 1) Sweep range : 144~149MHz
16. Tracking generator

PREPARATION

- 1) Unless otherwise specified, knobs and switches should be set as follows **Table 10.**

POWER SW	ON	SQUELCH VR	MIN
AL. SW	OFF	AF GAIN VR	MIN
PRIO SW	OFF	PHONE SW	OFF
LAMP SW	OFF	TONE SW	OFF
REV SW	OFF	VOICE SW	OFF
SCAN SW	OFF	DCL SW	OFF
LOW SW	OFF	C. SQ SW	OFF
F. LOCK SW	OFF	CS SW	OFF

Table 10

Fig. 20 MIC terminals (view from front panel side)

- 2) Use an insulated adjusting rod to adjust trimmers and coils.
- 3) To prevent damaging SSG, never set the stand by switch to SEND while adjusting the receiver section.
- 4) Be sure to turn the power switch OFF, before connecting the power cable to a power source.
- 5) SSG output levels are those at the time the output terminal is open.

ADJUSTMENT

RX ADJUSTMENT

NOTE : COMP = COMPOUND UNIT (X60-1250-10,-51)

Item	Condition	Measurement			Adjustment			Specification/Remarks
		Test equipment	Unit	Terminal	Unit	Part	Method	
1. Reset	1) Set the power SW on, while depressing PS key. Then, release the PS key. 2) When the lithium battery is replaced, the microprocessor must be reset. Set the power SW on, while depressing PS key and terminal shorted (near Q6 position) on CONTROL unit by driver, etc. Then, release the PS key.	Display					 Terminal	Tone sounds.
2. Voltage check	1) Power supply : 13.8V DC SQL VR ⤴ MIN (fully CCW)	DC VM	COMP.	8R		JP18		7.8V—8.6V

(X52-1330-20)

A black and white photograph of a coiled cable. The cable is dark-colored and has a braided or ribbed texture. It is coiled into a loose 'U' shape. At one end, there is a white, rectangular connector with a single slot, resembling a standard power plug. A small black band or tie is visible where the cable is coiled. The background is plain white.

PACKING

TM-2550A/E, 2530A SPECIFICATIONS

[General]	
Frequency range.....	144 MHz to 148 MHz (TM-2550A/2530A) 144 MHz to 146 MHz (TM-2550E)
Mode.....	FM F3 (F3E), F2 (F2D) (Control signal for DCL system)
Antenna impedance.....	50 ohms
Power requirement.....	13.8 VDC $\pm$ 15%
Grounding.....	Negative
Operating temperature.....	-20°C to +50°C (-4°F to +122°F)
Current drain.....	0.6 A in receive mode with no input signal (TM-2550A/2550E) Approx. 9.5A in HI transmit mode Approx. 3A in LOW transmit mode (TM-2530A) Approx. 6.5A in HI transmit mode Approx. 2.5A in LOW transmit mode
Dimensions.....	180 mm wide, 60 mm high 215 mm deep (TM-2550A/2550E) 195 mm deep (TM-2530A) (Projection not included)
Weight.....	1.95 kg (4.3 lbs) : TM-2550A/2550E 1.8 kg (4 lbs) : TM-2530A
[Transmitter]	
Output power (at 13.8 VDC, 50 ohms load).....	HI: 45 W min. (TM-2550A/2550E) HI: 25 W min. (TM-2530A) LOW: 5 W approx. (Adjustable up to out 40 W TM-2550A/2550E) (Adjustable up to out 20 W TM-2530A) Note: Recommended duty cycle 1 minute : Transmission 3 minutes : Reception
Modulation.....	Reactance
Frequency stability.....	Less than $\pm$ 15 PPM
Spurious radiation.....	Less than -60 dB
Maximum frequency deviation.....	$\pm$ 5 kHz
Audio distortion (at 60% modulation).....	Less than 3% (300 Hz to 3000 Hz)
[Receiver]	
Circuitry.....	Double conversion superheterodyne
Intermediate frequency.....	1st: 10.695 MHz, 2nd: 455 kHz
Sensitivity.....	SINAD 12 dB: Less than 0.25 μ V S + N/N : More than 50 dB at 1 mV input
Selectivity.....	More than 12 kHz (-6 dB) Less than 24 kHz (-60 dB)
Spurious response.....	Better than 70 dB (except fd-IF/2)
Squelch sensitivity.....	Less than 0.125 μ V (threshold)
Scan stop level.....	Less than 0.2 μ V (threshold)
Output.....	More than 1.5 W across 8 ohms load (5% distortion)
External speaker impedance.....	8 ohms
[DCL control]	
Code.....	NRZ equal-length code
Modulation.....	MSK modulation
Frequency deviation.....	$\pm$ 3.5 kHz reference
Mark frequency and deviation.....	1200 Hz $\pm$ 200 PPM
Space frequency and deviation.....	1800 Hz $\pm$ 200 PPM
Code transmission speed and deviation.....	1200 bits/second $\pm$ 200 PPM

Note: Circuit and rating are subject to change without notice due to development in technology.
