TS-780

CIRCUIT DESCRIPTION

Outline

The TS-780 is an all mode transceiver which covers both the 144 MHz and 430 MHz bands. It uses the double conversion system in the SSB and CW modes and the triple conversion system in the FM mode.

The first IF frequency is 30.865 MHz, the second IF frequency is 10.695 MHz and the third IF frequency is 455 kHz (FM mode only).

The unit includes a built-in IF SHIFT circuit, VOX circuit (which can be used as a semi break-in circuit), noise blanker, automatic scanning circuit (5 selectable scanning bandwidths), and memory scanning circuit.

Receiver section (Note : Items in brackets pertain to the 430 MHz band).

The 144 MHz [430 MHz] antenna input signal is applied to the front end (RF unit) of the receiver section through the diode switch in the 144 MHz final unit [430 MHz final unit].

The front end consists of an RF amplifier with a dual gate MOS FET (Q1 : 3SK76 or 3SK92) [a 2-stage RF amplifier using a dual gate MOS FET (Q5 : 3SK76-O) and a junction FET (Q7 : 2SK125)], a helical resonator with a bandwidth of 2 MHz [10 MHz], a 1st mixer (Q3 : 3SK74) [(Q8 : 3SK48)] and the first IF monolithic crystal filter (MCF). The 1st IF signal output from the front end is applied to the IF unit, where it is converted into the 2nd IF signal by the balanced mixer (Q1 and Q2 : 2SK125s) and filtered by the 2nd IF MCF.

The 10.695 MHz 2nd IF signal output from the 2nd IF MCF is then applied to both the SSB and FM IF circuits. In the SSB mode, the 2nd IF signal is applied to the crystal filter through the NB (noise blanker) gate, then is amplified by the IF amplifier consisting of Q9 through Q11.

The signal is then demodulated to an audio signal by the ring detector.

The noise component included in the 2nd IF signal is converted to a 455 kHz signal by the 3rd mixer (Q4 : 2SC1923 (O)), then amplified by Q5 and Q6 (2SC460(O)s) to switch the NB gate.

The AGC circuit picks up the signal from the last stage of the 2nd IF amplifier (Q11 : 3SK73(GR)), then detects and amplifies it to obtain the AGC voltage. The time constant setting of the AGC circuit is automatically switched between FAST (for the CW mode) and SLOW (for the SSB mode). The AGC voltage is applied to the 2nd IF amplifier (Q9 through Q11 : 3SK73(GR)s) and the 144 MHz RF amplifier (Q5 : 3SK76-O) [the 430 MHz RF amplifier (Q1 : 3SK92)], and is also used to drive the meter for S indication.

In the FM mode, the 2nd IF signal is applied to the 3rd mixer (Q4 : 2SC1923(O)) where it is converted to the 455 kHz 3rd IF signal.

The 3rd IF signal is filtered by the ceramic filter (CFW455E), then amplified by Q20 (TA7302P) and Q21-Q24 (2SC460 (B)s) and demodulated.

The squelch circuit consists of Q27-Q31, D30, and D31. The demodulated signal is amplified by Q27 and Q28 (2SC1815 (Y)s), then rectified by D30 and D31 to control the switching circuit consisting of Q29-Q31 (2SC1815 (Y)s) and Q32 (2SA1015 (Y)). The switching circuit turns the AF amplifier (Q33 : 2SC2240 (GR)) and the BUSY indicator on and off and applies scan stop signal SQS to pin 37 of IC3 (μ PD8035LC) on the control unit board (X53-1240-XX).

In all modes, the demodulated audio signal passes through AF amplifier Q33, the active LPF (Q34 : 2SC1815 (Y)) and the AF volume control circuit, and is then amplified by the power amplifier (Q35 : MB3713) to drive the speaker.

Unit	Mode/band	Frequency generated
CAR unit	FMT	10.695 MHz
	USB	10.6965 MHz

Fig. 1 Block diagram

TS-780

CIRCUIT DESCRIPTION

The DSB signal output from BM is buffered by Q42 (3SK73 (GR)), then filtered by the crystal filter (XF2) so that the SSB signal is obtained. The SSB signal is applied to the balanced mixer consisting of Q51 and Q52 (2SK125s) through buffer amplifier Q43 (2SK61). The balanced mixer converts the frequency of the SSB signal from 10.695 MHz to 30.865 MHz. The 30.865 MHz SSB signal is applied to the 2-stage BPF, where spurious signals are eliminated, then is applied to the TX unit as the transmission IF signal.

In the FM mode, the audio signal from FM MIC gain control VR4 in the AVR unit (X43-1420-00) is amplified by Q45 (TA7061P) and Q48 (2SC1815 (Y)) in the IF unit. The audio signal is then applied to D46 (1SV50S) to frequency modulate the 13.8533 MHz signal generated by Q49 (2SC460 (B)). The 13.8533 MHz FM signal is tripled to obtain the 41.56 MHz FM signal used as the local signal. The local signal is mixed with the carrier (the 10.695 MHz signal obtained by unbalancing BM) by Q51 and Q52, then is applied to the TX unit as the transmission IF signal in the same manner as the SSB signal.

In the TX unit, the 30.865 MHz transmission IF signal is amplified by Q1 (3SK73(GR)), then mixed with the VCO signal by the balanced mixer consisting of Q2 and Q3 (3SK74 (M)) [mixed with the 430 HET signal by the double balanced mixer (D15 : ND487C1-3R)] to obtain the 144 MHz [430 MHz] signal.

The 144 MHz signal is filtered by the BPFs and amplified by Q4 (2SK125), Q5 (2SC2026) and Q6 (2SC2538-22-A) to drive the 144 MHz final unit. [The 430 MHz signal is filtered by 2-pole helical resonators and amplified by Q9 (2SC2549), Q10 (3SK92), Q11 (2SC2026) and Q12 (2SC2762) to drive the 430 MHz final unit.]

In the 144 MHz final unit (X45-1200-00) [the 430 MHz final unit (X45-1210-00)], the signal is amplified by power module M57713 (final ASS'Y Q1) [M57716 (Q7)], then fed to the 144 MHz [430 MHz] antenna through the LPF. The ALC circuit picks up the signal from terminal 14D [43D] on the TX unit and amplifies it with Q7 (2SC1815 (Y)). This signal is applied to the 2nd gate of Q1 and the 2nd gate of Q42 (in the IF unit), and is also used to drive the meter for ALC indication. The ALC circuit system can be externally controlled.

Protection is provided by decreasing the source voltage of Q1 in the TX unit and the DB voltage supplied to the final units. HI/LOW power switching in the FM mode is also obtained in the same manner.

In the CW mode, keying is performed by switching the bias line to straight amplifier Q5 [Q11] in the TX unit with Q8 (2SA1015 (Y)).

CIRCUIT DESCRIPTION

Fig. 5 Power module M57716 Equivalent circuit

This is then amplified by the circuit consisting of two helical resonators, Q1, Q2 (2SC2549s) and Q3 (2SK125) and used as the 1st local signal for 430 MHz operation. The 2nd local signal is generated in the IF unit : Q49 (2SC460 (B)) generates a 13.8533MHz signal and Q50 (2SC1923 (O)) triples it. The 2nd local signal is frequency modulated in the FM mode, shifted by 800 Hz in the CW mode, and subject to RIT control in the SSB and CW modes by means of D46 (1SV50S). The 10.24MHz reference signal generated in the PLL unit is used as the 3rd local signal.

Fig. 6 MB3756 Equivalent circuit (AVR unit IC2)

HET Circuit

The VCO signal is used as the 1st local signal for 144 MHz operation. On the other hand, the 430 HET unit (X50-1790-00) is used for 430 MHz operation to generate the 1st local signal. In the 430 HET unit, Q4 (2SC460 (B)) generates 40.85714 MHz for the low band segment and 41.57143 MHz for the high band segment. Q5 (2SC2026) multiplies this to 286 MHz or 291 MHz. This 286 MHz or 291 MHz signal is amplified by the circuit consisting of two BPFs, Q6 (3SK92) and Q7 (2SK125), then mixed with the VCO signal by DBM (D1 : ND487C1-3R) to generate a 399.135 MHz–409.13498 MHz signal.

PLL Circuit

A block diagram of the PLL unit is shown in Fig. 7. This is a double loop PLL circuit consisting of A and B loops.

● Loop B circuit

The phase locked loop formed of IC7, IC8, IC12, Q21 and Q22 is called loop B. The VCO frequency is mixed with a 32.431 MHz signal to obtain a 12.7–14.698 MHz signal. This signal is divided by 100 so that a 127–146.98 kHz signal is obtained. The result is varied in 20 Hz steps because the VCO frequency is varied in 2 kHz steps.

● Loop A circuit

The phase locked loop formed of IC1, IC9, IC10, Q2, Q6 and Q7 is called loop A. The VCO generates a signal whose frequency is varied in 20 kHz steps over a bandwidth of about 5 MHz.

● Reference signal generator

Q16 generates the reference signal, which is applied to both loops A and B via buffer amplifiers. The reference signal is also used as the 3rd local signal for the receiver section.

● Local signal generator

The carrier frequency, which differs according to mode, is converted to $10.055 \text{ MHz} \pm 2.5 \text{ kHz}$. Up-conversion method is used for FM reception because the carrier frequency cannot be set to 10.695 MHz (the 2nd IF frequency). The 10.055 MHz signal is then mixed with the loop B output signal. The signal output by the mixer is filtered by the 10.192 MHz narrow band filter, then mixed with the signal from Q13 by the mixer consisting of Q3 and Q4. The output of the last mixer is fed to the loop A mixer (IC1) as the local signal.

● Unlock protection

The unlock signal from the loop A PLL IC (IC9) is applied to Q10 and Q11 to generate ULB and UL signals for preventing unwanted transmission.

Control Circuit

The microcomputer used in the control unit consists of 3 IC's, a CPU (IC3 : μ PD8035LC), ROM (IC4 : μ PD2332C-384) and RAM (IC5 : μ PD5101LC).

● Fundamental operation

CPU clock signal ALE is generated by dividing the 5.745 MHz signal produced by ceramic resonator X1 by 15 in CPU. The control program is stored in ROM and read out through the bus (DB0-DB7) in the following manner : CPU outputs an address to the bus, then the address data is latched by the address latch (IC13 and IC14) at the timing of ALE. The latched address is given to ROM. ROM outputs program data to the bus according to the given address when the CPU outputs PSEN. CPU reads this program data and executes it.

The above procedures are repeated as necessary.

For example, the following procedures are used when RAM is accessed. CPU outputs the RAM address to the bus and the address is latched at the timing of ALE.

The latched address is given to RAM when RAM is enabled by the most significant bit (that is, when $\overline{CE1}$ is logical "1").

When data (a VFO frequency or memory channel) is written in RAM, CPU outputs the data to the bus and sets $\overline{WR}$ to logical "1". When data is read from RAM, CPU sets $\overline{RD}$ to logical "1" and reads the data on the bus. $\overline{WR}$ and $\overline{RD}$ are applied to the R/W and OD terminals of RAM, respectively.

● Reset

When the line voltage reaches about 3.8 V after the power is turned ON, current flows through D1 (MA522 (R)) to turn Q1 ON. The level at pin 4 ($\overline{RESET}$) is then set to "L" and CPU is reset. As the line voltage rises further, the level at pin 4 of CPU returns to "H". CPU is reset whenever the power is switched ON or OFF, regardless of whether a backup battery is installed.

When the CPU is reset, program execution starts at program address 0 ; that is the CPU checks for the backup battery and, if it is not installed, the CPU initializes the frequency and resets the memory channels.

● Backup

During backup operation, power is supplied to RAM only. The reset signal is applied to CE2 (pin 17 of IC5) so that data to be backed up is protected when the main power is switched ON or OFF.

● Display

The 8-digit display indicates the function selected (A, B and CH No.) and the frequency in units of 100 Hz. The display is driven dynamically. The digit data is latched by the display digit latch (IC8 and IC9) for application to the display. CPU outputs 90 (HEX) to the bus before it outputs the digit data to the latch. 90 (HEX) is latched by the address latch (IC13 and IC14) at the timing of ALE. The latched data is applied to the address 90 detection gate (IC17A) to open it. Therefore, $\overline{WR}$ output from the CPU is applied to the EN terminal of the display digit latch through the address 90 detection gate. Thus, digit data output from the CPU is latched by the display digit latch.

The segment data is output from terminals P10 through P17 (pins 27 through 34) of the CPU and applied to the display.

● Display control signal generator

The signal generated by IC16 is differentiated, then shaped by IC15B. The shaped signal is applied to the $\overline{INT}$ terminal of the CPU. CPU operation is interrupted when the level at the $\overline{INT}$ terminal becomes "L" to output display data for one digit. After the display data is output, CPU continues the execution interrupted.

TS-780

CIRCUIT DESCRIPTION

• PLL data

16-bit PLL serial data for loops A and B is output simultaneously from terminals DTA and DTB. A clock pulse is output for each bit, and EN is output to the PLL unit after all bits have been output.

The CPU outputs (HEX) A0 to the bus, then this data is latched by the address latch (IC13 and IC14) at the timing of ALE.

The latched data is then applied to the address A0 detection gate (IC17B), whereupon the CPU outputs WR. At the same time, the CPU outputs the PLL data for loop A to DB3 and that for loop B to DB7.

Both loop A data and loop B data are output to the PLL unit through the gates (IC18C and IC18D) which are opened by the address A0 detection gate. WR is also used as the clock signal (CLK) for the programmable counters in the PLL unit. EN is output from pin 38 of the CPU.

PLL data is the same whether the frequency is 144.0000, 430.0000 or 435.0000. Data for loop A is 283 (decimal) and that for loop B is 6350 (decimal). The value for loop A (or B) increases by one as the frequency is increased by 20 kHz (or 20 Hz). The PLL data is output once when the frequency is changed.

CIRCUIT DESCRIPTION

Encoder waveform shaping

Square waves with a duty ratio of 50% are applied to V1 through V4. The waves applied to V1 and V3 are 180 degrees out of phase with those applied to V2 and V4, respectively, and the wave applied to V1 leads that applied to V3 by 90 degrees. These waves are differentiated. The square

waves and the differentiated waves are subjected to logical operations to obtain the VFO pulse signals.

IC10 is the gate which closes during FM CH operations. IC15C and IC15D form an RS flip-flop used for determining the direction of rotation of the encoder.

Fig. 14 Encoder waveform shaping

UP and DOWN switch signal processing

The microphone UP and DOWN switch signals and the AND UP and DOWN switch signals are applied to gates IC6A, IC6D, IC7A and IC7D.

The CPU outputs A0 (HEX) to the bus at the prescribed timing; this address data is latched by the address latch (IC13 and IC14), then is applied to the address A0 detection gate (IC17C). This gate opens the gates in IC6 and IC7 when the CPU outputs $\overline{RD}$ to allow the CPU to read the switch status.

I/O expansion ports

When an I/O operation is performed through the I/O expansion ports, the CPU outputs an "L" level signal from terminal P24 or P25 (pin 35 or 36) to select IC2 or IC1.

The I/O operation is performed in 4 bit units through ports 4 through 7 (of IC1 and IC2). Ports 6 and 7 of IC1 are used only for output, while ports 4 and 5 of both IC1 and 2 are used only for input. The CPU outputs PROG as the clock signal for the expansion ports.

Table 18 Functions of μ PD8035LC

DC Operation

No DC power cable is provided with the TS-780. Purchase a DC power cable such as that shown in Fig. 15 for DC operation. Since this cable does not include a fuse, use a 7A fuse in the TS-780.

DC power cables and fuses are available at any Kenwood branch or service center. The part number of the DC power cable assembly is E30-1622-05.

Fig. 16 DC cable

TS-780

PARTS LIST

Note 1:

K: U.S.A. T: Britain W: Europe X: Australia

Note 2:

Only special type of resistors (example: cement, metal film, etc.) and capacitors (example: electrolytic, tantalum, mylar, temp. coeff. capacitors) are detailed in the PARTS LIST. For the value of all common type components, refer to the schematic diagram of the P.C. board illustration. Resistors not otherwise detailed are carbon type (1/4W or 1/8W). Order carbon resistors and capacitors according to the following example:

A carbon resistor's part number is RD14BY 2E222J.

A ceramic capacitor's number is CK45F1H103Z, CC45TH1H220J.

RESISTOR

1. Type of the carbon resistor

RD14BY RD14CB (small size)
RD14BB (small size) RD14CY RD14CB (small size)

2. Wattage

1W → 3A 3W → 3F 5W → 3H
2W → 3D 4W → 3G

3' = CC45 ○ ○ ...

Ceramic capacitor (type I) temperature coeff. capacitor 1' 3'

1st word (Color)	C (Black)	L (Red)	P (Orange)	R (Yellow)	S (Green)	T (Blue)	U (Violet)
ppm/°C	0	-80	-150	-220	-330	-470	-750

3 = CK45 ○

Ceramic capacitor (type II) 3

Cord	B	D	E	F
Operating temperature °C	-30 +85	-30 +85	-30 +85	-10 +70

6 = Tolerance

Cord	C	D	G	J	K	M	X	Z	P	No cord
(%)	±0.25	±0.5	±2	±5	±10	±20	+40 -20	+80 -20	+100 -0	More than 10 μF -10 ~ +50 Less than 4.7 μF -10 ~ +75

Less than 10 pF

Cord	B	C	D	F	G
(pF)	±0.1	±0.25	±0.5	±1	±2

Abbreviation	Cap.	Capacitor	ML	Mylar
C	Ceramic	S	Styren	
E	Electrolytic	T	Tantalum	
MC	Mica			

3. Resistance value

② ② → means $22 \times 10^2 = 2200\Omega$ (2.2 kΩ)
Example 221 → 220Ω 223 → 22 kΩ 225 → 2.2 MΩ
222 → 2.2 kΩ 224 → 220 kΩ

4. Tolerance

J = ±5% (Gold) K = ±10% (Silver)

CAPACITORS

Type I

CC 45 TH 1H 220 J CK 45 F 1H 103 Z
1' 2 3' 4 5 6 1 2 3 4 5 6

1 = Type ... ceramic, electrolytic, etc. 4 = Voltage rating
2 = Shape ... round, square, etc. 5 = Value
3 = Temp range 6 = Tolerance
3' = Temp coefficient

Ex. CC45TH = -470 ±60 ppm/°C

2nd Word	G	H	J	K	L
ppm/°C	±30	±60	±120	±250	±500

5 = Capacitor value

Example 010 → 1 pF
100 → 10 pF
101 → 100 pF
102 → 1000 pF = 0.001 μF
103 → 0.01 μF

TRANSMITTER SECTION

Notes :

1. The levels in front of terminals 14D and 43D are measured with the coaxial cable disconnected from the TX unit.
2. The levels in the microphone amplifier are measured with an audio voltmeter, and others are measured with an RF voltmeter.

ADJUSTMENT

REQUIRED TEST EQUIPMENT

1. **DC V.M**
 - High input impedance
2. **RF VTVM (RF V.M)**
 - Input impedance: $1M\Omega$ min., 2pF max
 - Voltage range: F.S = 10 mV ~ 300V
 - Frequency range: Up to 450 MHz
3. **Frequency Counter (F count)**
 - Input sensitivity: Approx. 50 mV
 - Frequency range: Up to 450 MHz
4. **DC Power Supply**
 - Voltage: 10V ~ 17V, variable
 - Current: 6A min
5. **Power Meter**
 - Measurement range Approx. : 30W, 3W, 1W.
 - Input impedance: 50 Ω
 - Frequency range: 450 MHz
6. **AF VTVM (AF V.M)**
 - Input impedance: $1M\Omega$ min.
 - Voltage range: F.S = 1 mV ~ 30V
 - Frequency range: 50 Hz ~ 10 kHz
7. **AF Generator (AG)**
 - Output frequency: 100 Hz ~ 10 kHz
 - Output voltage: 0.5 mV ~ 1V
8. **Linear Detector**
 - Frequency range: 450 MHz
9. **Field Strength Meter**
 - Frequency range: 450 MHz
10. **Directional Coupler**
11. **Oscilloscope**
 - High sensitivity oscilloscope with horizontal input terminal
12. **SSG**
 - Frequency range: 144 MHz and 430 MHz band.
 - Modulation: AM and FM MOD.
 - Output level: -20 dB to 100 dB
13. **Dummy Load**
 - 8 Ω , 5W (approx.)
14. **Noise Generator**
 - Must generate ignition-like noise containing harmonics beyond 450 MHz.
15. **Sweep Generator**
 - Sweep range: 144 MHz and 430 MHz bands
16. **Tracking generator**

Preparation

- 1) Unless otherwise specified. Knobs and switches should be set as follows **Table 19**.

POWER SW	ON	SSB MIC VR	MIN
SEND/REC SW	REC	RIT VR	CEN
VOX/MAN SW	MAN	IF SHIFT VR	CEN
ALC/CEN/RF/S SW	RF/S	SQUELCH VR	MIN
NB SW	OFF	RF GAIN VR	MAX
LOW/HIGH SW	HIGH	AF GAIN VR	MIN

PRIO.M 	OFF	RIT SW	OFF
TX-OFFSET SW	SIMP	SCAN SW	OFF
TONE SW	OFF	MS 144 SW	OFF
MODE SW	USB	MS 430 SW	OFF
FUNCTION SW	A	MR SW	OFF
MEMORY	1	F.LOCK SW	OFF

Table 19

Fig. 17 MIC terminals (view from front panel side)

- 2) Use an insulated adjusting rod to adjust trimmers and coils.
 - 3) To prevent damaging SSG, never set the stand by switch to SEND while adjusting the receiver section.
 - 4) Be sure to turn the power and VOX switches OFF before connecting the power cable to a power source.
- Note:** The set enters the transmission mode for an instant when the power switch is turned ON with the VOX switch ON.
- 5) SSG output levels are those at the time the output terminal is open.

Backup current (Battery)	Less than 10 μ A
Semiconductor Complement	Transistors: 149 FETs: 35 ICs: 41 Diodes: 195
Dimensions	290 (W) x 124 (H) x 322 (D) mm (11 ³ / ₁₆) x (4 ⁷ / ₈) x (12 ⁵ / ₈)
Weight	10.1 kg (22.2 lbs)

TRANSMITTER SECTION

RF Power Output	SSB, CW, FM: 10 watts FM (LOW): Approx. 1 watt
Modulation	SSB: Balanced modulation FM: Variable reactance frequency shift
Maximum frequency deviation (FM)	$\pm$ 5 kHz
Carrier Suppression	Better than 40 dB
Unwanted Sideband Suppression	Better than 40 dB
Spurious Radiation	Better than -60 dB
Microphone Impedance	500 ~ 600 Ω
AF Response of Transmitter (SSB)	400 ~ 2600 Hz (-9 dB)
Repeater Frequency Shift	-600 kHz or +600 kHz (144.0 ~ 146.0 MHz) -7.6 MHz or -1.6 MHz (430.0 ~ 440.0 MHz)
RPT Tone Frequency	1750 Hz

RECEIVER SECTION

Receiver Sensitivity	SSB, CW: 0.2 μ V for 10 dB (S+N)/N FM: 1 μ V for 30 dB (S+N)/N 0.2 μ V for 12 dB SINAD
Intermediate Frequency	1st: 30.865 MHz 2nd: 10.695 MHz 3rd: 455 kHz (FM only)
Squelch Sensitivity	0.16 μ V (At threshold)
Audio Output	2.0 watts (with less than 10% distortion) into an 8 ohm load
Receiver Selectivity	SSB, CW: 2.2 kHz (-6 dB) 4.8 kHz (-60 dB) FM: 14 kHz (-6 dB) 30 kHz (-60 dB)

Circuit and ratings are subject to change without notice for improvement.

TS-780

BLOCK DIAGRAM/SP-71

SP-71 SPECIFICATIONS

Speaker: 4.75" (12 cm)
Rated Input: 2.0 Watts
Impedance: 8 ohms
Frequency Range: 300 Hz to 5 kHz
Dimensions: 6.3" (160) (W) x 4.8" (123) (H) x 7.9" (200) (D) (mm)
Weight: 2.8 lbs (1.25 kg)

PARTS LIST

N : New parts

Parts No.	Re- marks	Description	Ref. No.
A01-0915-03	N	Case (A) upper	
A01-0916-03	N	Case (B) lower	
A21-0744-03	N	Ornamental panel	
B01-0644-03	N	Panel escutcheon x 2	
B05-0702-04		Grill cloth	
B43-0668-04	N	Name plate	
B50-3931-00	N	Operating manual	
E12-0001-05		Phone plug	
E20-0208-04		Terminal board	
E29-0005-04		Y lug x 2	
H01-2782-04	N	Carton case (inside)	
H12-0402-04		Cushion x 2	
H20-0274-13		Protective cover	
H25-0049-03		Protective bag	
J01-0025-04		Assistant foot	
J02-0049-14		Foot x 4	
N15-1040-46		Flat washer x 4	
N30-4008-45		Round screw	
N30-4010-11		Round screw x 4	
N30-4024-46		Round screw x 2	
N32-3006-46		Flat screw x 6	
N35-3006-45		Bind screw x 14	
N61-3516-41		Self tapping screw x 2	
N87-3006-41			
T06-0011-05		Speaker
