1. Specifications

ALLOVER CHARACTERISTICS

Output Power (Tuner, Aux, Tape → SP. out)	: 100 watts per channel min. RMS (both channels driven, into 8 ohms from 20 Hz to 20 kHz with THD less than 0.005 %) 105 watts per channel min. RMS (both channels driven, into 8 ohms at 1 kHz)
Total Harmonic Distortion (Tuner, Aux, Tape → SP. out)	: 0.005 % at rated output, from 20 Hz to 20 kHz, 8 ohms 0.0005 % at rated output at 1 kHz, 8 ohms (Measured by HP-IB AUDIO ANALYZER SYSTEM) 0.02 % at rated output, from 20 Hz to 80 kHz, 8 ohms
Intermodulation Distortion (Tuner, Aux, Tape → SP. out)	: 0.002 % at rated output, 8 ohms
Power Band Width (Tuner, Aux, Tape → SP. out)	: 5 Hz — 100 kHz (IHF, both channels driven, 8 ohms, 0.02 % THD)
Frequency Response (Tuner, Aux, Tape → SP. out)	: DC — 200 kHz $\begin{smallmatrix} +0 \\ -3 \end{smallmatrix}$ dB
Damping Factor	: 200 (1 kHz, 8 ohms)
Input Sensitivity/Impedance	
	Phono — 1, 2 (MM) : 2.5 mV/100, 47 k, 100 kohms
	Phono — 1, 2 (MC) : 200 μ V/100 ohms
	TUNER, AUX, TAPE : 200 mV/50 kohms
Signal to Noise Ratio	Phono — 1, 2 (MM) : 85 dB (IHF, A net, short circuit), 82 dB (NEW IHF)
	Phono — 1, 2 (MC) : 71 dB (IHF, A net, short circuit), 75 dB (NEW IHF)
	TUNER, AUX, TAPE : 110 dB (IHF, A net, short circuit), 85 dB (NEW IHF)
Tone Controls	BASS : ± 8 dB (100 Hz)
	TREBLE : ± 8 dB (10 kHz)
Subsonic Filter	: -6 dB/oct. (18 Hz)
Muting	: -20 dB
PHONO EQUALIZER SECTION (Phono → Rec. Out.)	
Phono Overload	Phono — 1, 2 (MM) : 350 mV at 1 kHz, 0.005 % THD
	Phono — 1, 2 (MC) : 26 mV at 1 kHz, 0.005 % THD
RIAA Phono Equalization	: ± 0.2 dB (20 Hz — 20 kHz)
Total Harmonic Distortion	
	Phono — 1, 2 (MM) : 0.004 % at 25 V output, 20 Hz — 20 kHz
	Phono — 1, 2 (MC) : 0.006 % at 25 V output, 20 Hz — 20 kHz
Rec. Output/Impedance	: 200 mV/330 ohms
Dimensions	: 6-1/4"(H) x 17-3/4"(W) x 16-3/4"(D) (15.9 cm(H) x 45.0 cm(W) x 42.4 cm(D))
Weight	: 36.5 lbs (16.6 kg)

Power Source and Power Consumption

Areas	Line Voltage & Frequency	Power Consumption
U.S.A.	AC 120 V, 60 Hz	400 W
CANADA	AC 120 V, 60 Hz	505 VA
[EUROPE U.K. & AUSTRALIA]	AC 110/120/220/240 V~	660 W
	Selectable, 50 Hz	
OTHER AREAS	AC 110/120/220/240 V~	660 W
	Selectable, 50/60 Hz	

Design and specifications subject to change without notice.

2. Removal of Top Cover and Bottom Plate

Procedure (Top Cover)

1. Remove 4 screws from the Metal cover.
2. Remove 2 screws from the rear panel back of Metal cover.

Procedure (Bottom Plate)

1. Remove 18 screws from the bottom cover.

5. Block Diagram

Fig. 11

6. Adjustment Procedures

6-(1) Main Amp. Center Voltage

1. Before tuning on the power, set semi-fixed resistors R305 (L channel) and R306 (R channel) of the drive amplifier and regulated power voltage amplifier circuit

board (TXX-183B-1) to the center position (refer to Fig. 12).

Fig. 12

2. Five minutes after the power is turned on, adjust semi-fixed resistors R305 and R306 so that the voltage between the test points of the power circuit board becomes ± 10 mV or less.

L channel: Measure the voltage between test point 19 and test point 22 (ground).

R channel: Measure the voltage between test point 7 and test point 4 (ground).

The measurements can also be performed at the speaker terminals if the relay is operating normally.

Fig. 13

6-(2) Main Amp. Idling Current

1. Before turning on the power, turn semi-fixed resistors, R513 (L channel) and R514 (R channel) of the bias control and protection circuit board, fully counterclockwise (refer to Fig. 13).

2. After turning the power on, adjust R513 and R514 and so that the voltage between the test points of the power amplifier (see Fig. 13) is within the range 40 mV – 60 mV.

L channel: Measure the voltage between test points 17, 18, 20 and 21, and test point 19 (center point).

R channel: Measure the voltage between test points 5, 6, 8 and 9, and test point 7 (center point).

3. About 10 minutes after the power is turned on with the heat sink hot enough, readjust R513 and R514 so that the voltage between the test points becomes 50 mV. Then, confirm that no voltage variation is observed after the heat sink temperature increases further.

Note: Be sure to perform the measurement with the probes and cabinet of the measuring equipment separated from the ground terminals of A-X9 or of other measuring equipment.

The A-X9 may be damaged if this is neglected.

7. Servicing Procedures

7-(1) Main Amp.

Troubleshooting and servicing for damaged power transistors are most difficult with this unit. These are explained here.

The power amplifier of A-X9 has a configuration shown in Fig. 14. Servicing should be performed with consideration paid for separation of the stages.

Standard simplified servicing methods must be avoided when repairing the Super A amp. Turning on the power immediately after replacing the power transistors because they have been damaged or replacing the parts for the right channel with those for the left channel or vice versa (this

method is often employed when repairing a stereo circuit) must be avoided strictly.

Note: Servicing procedures for the left channel are given here together with those necessary for the right channel. However, similar servicing should be performed for both channels at the same time so that the performance of the left and right channels is the same.

If this is neglected, the parts of the channel which was normal may be damaged.

Fig. 14

1. Troubleshooting

- 1) Separate the power amplification stage from the bias stage to check the stage with trouble.
 - (1) Remove one of the leads of resistors R437 (560 Ω) and R439 (47 Ω) to disconnect the bias stage from the power amplification stage.
 - (2) Connect the bases of X421 (2SC2229) and X423 (2SA949) through a resistor of approx. 1 kΩ so that DC bias current is not applied to the first stage of the power amplifier.
 - (3) Remove the power limiters X417 (2SC458) and X419 (2SA1029).
 - (4) Remove the overcurrent prevention diodes D401 and D403 (1SS81).
 - (5) Remove the 3-pin connector (3 pins 1, 2, 3 on the power amplifier circuit board TXX-182B-1) which is employed to provide feedback from the output stage to the first stage.

- (6) Remove one of the wires (the wire between S and S' on the circuit board TXX-182B-1) by which the output voltage is transmitted from the output center point to the Super A bias circuit.

Note: For the right channel, the wire with the same function as that between S and S' is jumper wire W417.

- (7) Mount the external parts shown in Fig. 15 to allow feedback, and set Subsonic and Tone switches to the OFF positions.

Method to allow the negative feedback in the bias circuit

Fig. 15

- (8) Remove the 3-pin connector (the connector is in the wiring connecting 23, 24, 25 on power amplifier circuit board TXX-183B-1 with the B coil of the transformer) with which the $\pm B$ voltage is supplied to the power amplification stage. Set the power amplification stage in the non-operation stage.
- (9) Turn on the power. Measure the voltage between the collectors of X409 (2SA899) and X411 (2SC1904). Reduce the output volume to the minimum level to prevent an unnecessary input from being applied. Turn semi-fixed resistor R513 to adjust the bias current to check that the voltage variation is 3.5 – 4.7 V. If it is, the signal amplification circuit from the first stage to the Super A bias circuit is normal.
In this measurement an error of 0.2 – 0.3 V is allowable. However, if the error exceeds 0.5 V, trouble exists with the circuit.
As to polarity, the X409 (2SA899) side is positive and the X411 (2SC1904) side is negative.
Be sure to fully turn R513 after the checking so that the measured voltage becomes minimum.
- 2) If there is no trouble prior to the bias stage as described in 1-(9), repair the power amplification stage. For repairing, refer to "5. Repairing the power amplification stage".
- 3) If trouble exists before the bias circuit output, perform repairing following the order of; Impedance conversion stage → Super A bias circuit stage as described in "2. Repairing the voltage amplification stage".

2. Repairing the voltage amplification stage

- 1) Prepare the additional parts to be mounted outside <refer to 1-1-(7)> and a wire to be employed for shorting.

Mount as shown in Fig. 16.

Fig. 16

- 2) Remove the 7-pin connector (pins 10 – 16 of the power amplifier circuit board TXX-182B-1) connecting the voltage amplification stage with the impedance conversion stage first. (A value of 0 V should be obtained by adjusting semi-fixed resistor R305.)
- 3) Check if the offset voltage (the output voltage of the voltage amplification circuit TXX-183B-1 at pins 7 or 8) is correct.
- 4) Turn the output volume control to the maximum position and read the gain and the maximum output level at the points mentioned above.
Gain → 43 dB $\pm$ 1 dB
Maximum output level → Approx. 40 V rms
- 5) If the conditions in steps 3 and 4 are satisfied, this stage is normal.

3. Repairing the impedance conversion stage

- 1) Remove the shoring wire fitted in step 2-1. Refit the externally mounted parts for negative feedback to the original positions shown in 1-1-(7).
- 2) Insert the connector which has been disconnected in step 2-2.
- 3) Remove the connector Super A bias circuit board TAS-30A from the power amplifier circuit board TXX-182B-1.
- 4) Check if the offset voltage can be properly adjusted at the output point (point 53 of TXX-182B-1) of the impedance conversion stage (0 V should be obtained by adjusting semi-fixed resistor R305).
- 5) Check the gain and maximum output voltage at the same test point in the same way as with the voltage amplification stage.

Note: Since no gain is available at the impedance conversion stage, the gain between the input and this stage is 43 dB.

(The maximum output level becomes approx. 38 – 40 V rms due to some loss.)

- 6) If the conditions in steps 4 and 5 are satisfied, operation between the input and this stage is normal.

4. Repairing the Super A bias circuit

- 1) Insert the Super A bias circuit board TAS-30A into the specified position.
- 2) Repair the circuit until the conditions in 1-1-(9) become satisfactory.
- 3) Repairing hints

- Check if a voltage 1.8 — 2 V is available between the collectors and emitters of X413 and X415 (2SC458) of the battery circuit.
- Check if the emitter voltage of X509 (2SC458) is lower than its base voltage by 0.6 — 0.7 V.
- Check if the emitter voltage of X511 (2SA1029) is higher than its base voltage by 0.6 — 0.7 V.
- Check if the voltage between the emitter and base of X505 (2SA1029) is almost the same as that between the base and emitter of X509 (2SA1029).
- Check if the voltage between the collector and emitter of X507 (2SC458) is almost the same as that between the base and emitter of X511 (2SC458).
- Check if the regulated current circuit of X409 (2SA899) and X411 (2SC1904) correctly provides the regulated current of approx. 4 mA.

Note: If a voltage of approx. 4.8 V is present between the terminals of R419 and R421 (1.2 k), a current of approx. 4 mA is available at the emitters of X409 and X411.

- Check if the regulated current circuit of X501 (2SA899) and X411 (2SC1904) correctly provides the regulated current of approx. 8 mA.

Note: If a voltage of approx. 5 V is present between the terminals of R501 and R503 (680 Ω), the circuit is operated normally as above.

- Check if the Zener diode in the base bias circuit of the regulated power current transistor provides the correct voltage.

Note: Trouble cannot be detected by merely checking the Zener diode resistance in the forward and backward directions, using a tester. Checking with a tester may not be effective to distinguish a usable Zener diode from a defective one (even the voltage is reduced by 30 — 40 percent).

- Check if Schottky diodes D503 and D505 are not open or short-circuited.
- Check if resistors R523 and R525 (47 Ω) are not open due to being burnt out.
- Check if a voltage variation of 0.6 — 0.8 V ($V_{BE} + 0.1$ V) is obtained between the collector of X505 (2SA1029) and the emitter of X507 (2SC458) by turning semi-fixed resistor R513 for bias adjustment. If the voltage variation is not obtained, also check the resistor itself.

Be sure to fully turn the semi-fixed resistor counter-clockwise after adjustment.

5. Repairing the power amplification stage

- 1) Repairing this stage is not so difficult. However, if the repairing is not complete, the expensive output transistors may be damaged again. Repair taking care of the following points.

- Is R455 (68 Ω 1/2 W) broken?
- Is R455 (820 Ω 1/2 W) burnt out? Is it open?
- Are R411 and R443 (47 Ω) burnt out? Are they open?
- Are R437 (560 Ω) and R439 (47 Ω) burnt out? Are they open?

- 2) Before turning on the power be sure to confirm that the bases of X421 (2SC2229) and X243 (2SA949) are connected through a resistor of around 1 k Ω .

- 3) Checking when turning on the power

- (1) Check that the voltage between the bases of X421 (2SC2229) and X423 (2SA949) and ground is 0 V using a voltmeter (tester) having a low internal resistance.

- (2) Check if the voltage between the base/emitter of all transistors comprising the Darlington circuit and ground is 0 V using the same voltmeter as in (1).

- 4) Overall checking

After completion of repairing of each stage, put the checked sections back in their original states, except the power limiters and overcurrent prevention diodes.

- Exercise care with the following.

Is the bias circuit board connected?

Is the resistor for idling current adjustment correctly set?

Are the resistors that were removed replaced?

Are the jumper wires that were removed replaced?

Are the parts that were externally mounted removed?

Are the connectors connected?

After confirming these points, turn on the power.

- (1) Adjust the idling current and offset voltage referring to the section "Adjustment procedure".

- (2) Check the maximum output voltage while the output level is gradually increased with the control with a load connected to the output terminals.

- (3) Perform the checking of 2. through an 8 Ω resistor.

- (4) Perform the checking of 2. through a 4 Ω resistor.

- (5) After replacing power limiters X417 (2SC458) and X419 (2SA1029) in their original state, check if the non-clip output with a 4 Ω resistor is less than 19 V at 1 kHz.

- (6) After replacing diodes D401 and D403 (1SS81) in their original state, check that operation is correct.

7-(2) Indicators

1. Indicator lamp circuit design

The circuit consists of 2 blocks; one comprises the 5 series connected lamps "POWER" — "TONE" and the other consists of the 7 series connected lamps "MUTING" — "MC". The lamps light with the regulated current from the 2 regulated current circuits with a common base circuit.

2. Defective lamp phenomena and troubleshooting

If a lamp is defective, not only all the lamps in the same block but lamps in the other block may not light. Consequently, if other lamps which have been lighting do not light when a switch is operated, the lamp related with the switch is defective.

(Example: If other lamps which have been lighting do not light when the AUX switch is pressed, it means that the AUX lamp is defective.

For the same reason, if the POWER indicator lamp is defective, other lamps do not light even when the power switch is turned on.)

8. Printed Circuit Board Ass'y and Parts List

8-(1) TXX-182B Power Amp. and Speaker Connector P.C. Board Ass'y

- ① TXX-182B-1: Power Amp. P.C. Board Ass'y
- ② TXX-182-2: Speaker Connector
P.C. Board Ass'y

Note:

The specific symbols (赤・黒・白 etc.) on a surface of above P.C. Board are actually unrelated to the repair service and are significant denotement in order to process the proper assembly of P.C. Board at the factory.

Fig. 25

10. Accessories List

Item No.	Part Number	Description	Q'ty
1	E30580-725A	Instruction Book	1
2	See table below.	Warranty Card	1
3	E64207-002	Envelope for Instruction Book and Warranty Card	1
4	BT20024B	"Do It Better" (for U.S.A. only)	1
5	BT20023	Service Procedures (for U.S.A. only)	1
6	QMF51A2-3R15S or 6R3S	Fuse (for U.S. Military Market and Others) ⚠	1
7	E64208-001	Envelope for Fuses (for U.S. Military Market and Others)	1
8	E66188-028 or 029	Fuse Label (for U.S. Military Market and Others)	1
9	E64216-002	Caution Tag (with Power Cord for Military Market only)	1

Warranty Card

U.S.A.	Canada	U.S. Military Market	Europe	Australia	U.K.
BT20032B	BT20025C	BT20032	—	BT20029B	BT20013B

[illegible]

1. — indicates positive B power supply.

2. — indicates negative B power supply.

3. ■■■ indicates the signal path.

4. Voltage values measured with a tester (impedance 20 k Ω /V) in mode of "no signal" are indicated as below:

Example: -0.3 (unit: V)
-0.0 (unit: V)

5. When replacing the Δ marked parts, be sure to use the designated parts after safety.

Power cord	: Different in different areas. See page 28.
AC outlet	: Different in different areas. See page 28.
Power switch	: QSP2111-031
Fuse	: Different in different areas. See page 28.
Power transformer	: E03617-14B
Ceramic condenser	: Different in different areas. See page 28.
Relay	: ESK1D24-113 (RY701)
Cement resistor	: ERF031K-3R3 (R703)
Incombustible oxide of metal film resistor	: ORC0207J-(R701, R702)
Incombustible metal film resistor	: ORX0207J-(R201~R204)
Incombustible metal film resistor	: QRD149J-(R159~ R162, R479, R480)
Fusible resistor	: QRZ0049-(R475~R478) QRZ0050-(R615, R616)

6. Resistors are indicated as follows;

● Unit	No indication	: Ω
		: K
		: k Ω
		: M
		: M Ω
		: W
		: watt
● Deviation No indication		: $\pm 5\%$
		: J
		: $\pm 5\%$
		: K
		: $\pm 10\%$
● Type	No indication	: Carbon resistor

7. Capacitors are indicated as follows;

● Unit	No indication	: μ F
		: μ
		: P
		: F

8. This is the standard circuit diagram. The design and components are subject to change without notice

P.C. Board Ass'y	Description	Page
TXH-182B	Power Amp. and Speaker Connector P.C. Board Ass'y	12
TAS-30A	Bias Control and Protector P.C. Board Ass'y	15
TXH-183B	Driver Amp. and Tone Control P.C. Board Ass'y	16
TAE-128B	Equalizer Amp. P.C. Board Ass'y	19
TXH-184A	Switch Unit P.C. Board Ass'y	22
TXH-185B, C or D	Electrolytic Capacitors P.C. Board Ass'y	23
TSP-122B	Pin Jack P.C. Board Ass'y	24
TSP-219A, B or C	AC Outlets and Voltage Selector P.C. Board Ass'y	24
