

Service Manual

QUARTZ Direct Drive
Automatic Turntable System

Turntable System
SL-MA1

is the standard mark for the "P-mount" plug-in-connector system. Products carrying this mark are inter-changeable and compatible with each other.

Areas	
[M]	U.S.A.
[MC]	Canada.
[E]	Switzerland and Scandinavia.
[EK]	United Kingdom.
[XL]	Australia.
[EG]	F.R. Germany.
[EB]	Belgium.
[EH]	Holland.
[EF]	France.
[Ei]	Italy.
[EC]	Czechoslovakia.
[XA]	Southeast Asia, Oceania, Africa, Middle Near East and Central South America.
[XM]	Central South America.
[XZ]	New Zealand.

SPECIFICATIONS

■ Turntable section

Type:	Quartz direct drive Automatic turntable Auto start/Auto lead-in
Features:	Optical auto size select Optical auto speed select Auto return/Auto stop Repeat play 2-speed search play
Drive method:	Direct drive
Motor:	Brushless DC motor
Drive control method:	Quartz-phase-locked control
Turntable platter:	Aluminum die-cast Diameter 32.5 cm (12-13/16")
Turntable speeds:	33-1/3 rpm and 45 rpm Auto speed select (Manual selection possible)
Wow and flutter:	0.012% WRMS* 0.025% WRMS (JIS C5521) ± 0.031% peak (IEC 98A Weighted)
Rumble:	-70 dB (IEC 98A Unweighted) -81 dB (IEC 98A Weighted)

* Measured by obtaining the signal from the built-in frequency generator of the motor assembly.

■ Tonearm section

Type:	Static balanced type Straight pipe tonearm 4-pivot gimbal suspension T4P type
--------------	--

Features:

Effective length:	23 cm
Tracking error angle:	Within 2° 32' at the outer groove of 30 cm (12") record Within 0° 32' at the inner groove of 30 cm (12") record
Effective mass:	9 g (including cartridge)
Resonance frequency:	10 Hz
Tonearm drive motor:	Brushless DC motor
Phono cable capacitance:	100 pF

■ Cartridge section (Except for U.S.A. and Canada)

Model No.:	EPC-P33
Type:	Moving magnet stereo cartridge
Magnetic circuit:	All laminated core
Frequency response:	10 Hz ~ 50 kHz 20 Hz ~ 10 kHz ± 1 dB
Output voltage:	2.5 mV at 1 kHz, 5 cm/s. Zero to peak lateral velocity (7 mV at 1 kHz, 10 cm/s. Zero to peak 45° velocity [DIN 45 500])
Channel separation:	22 dB at 1 kHz
Channel balance:	Within 1.8 dB at 1 kHz
Recommended load impedance:	47 kΩ ~ 100 kΩ
Compliance (dynamic):	12 × 10 ⁻⁶ cm/dyne at 100 Hz
Stylus pressure range:	1.25 ± 0.25 g (12.5 ± 2.5 mN)
Weight:	6 g (cartridge only)
Replacement stylus:	EPS-33ES (elliptical)

General

Power supply: For U.S.A. and Canaca
AC 120V, 60 Hz
For other countries
~ 110-127/220-240V, 50 or 60 Hz

Power consumption: For U.S.A. Canada 15W/2W
with the power switch OFF.
For other countries 18W/2W
with the power switch OFF.

Dimensions: 45.3 x 17 x 40.8 cm
(W x H x D) (17-27/32" x 6-11/16" x 16-1/16")
Maximum height when dust cover is open
45.3 x 52 x 60 cm
(17-27/32" x 20-15/32" x 23-5/8")

Weight: 9 kg (19.8 lb.)

Specifications are subject to change without notice for further improvement.
Weight and dimensions shown are approximate.

SAFETY PRECAUTION (This "safety precaution" is applied only in U.S.A.)

- 1. Before servicing, unplug the power cord to prevent an electric shock.
- 2. When replacing parts, use only manufacturer's recommended components for safety.
- 3. Check the condition of the power cord. Replace if wear or damage is evident.
- 4. After servicing, be sure to restore the lead dress, insulation barriers, insulation papers, shields, etc.
- 5. Before returning the serviced equipment to the customer, be sure to make the following insulation resistance test to prevent the customer from being exposed to a shock hazard.

INSULATION RESISTANCE TEST

- 1. Unplug the power cord and short the two prongs of the plug with a jumper wire.
- 2. Turn on the power switch.
- 3. Measure the resistance value with ohmmeter between the jumpered AC plug and each exposed metal cabinet part, such as screwheads antenna, control shafts, handle brackets, etc. Equipment with antenna terminals should read between 3MΩ and 5.2MΩ to all exposed parts. (Fig. A) Equipment without antenna terminals should read approximately infinity to all exposed parts. (Fig. B)

Note: Some exposed parts may be isolated from the chassis by design. These will read infinity.

(Fig. A)

Resistance = 3MΩ—5.2MΩ

(Fig. B)

Resistance = Approx ∞

- 4. If the measurement is outside the specified limits, there is a possibility of a shock hazard. The equipment should be repaired and rechecked before it is returned to the customer.

MEASUREMENTS AND ADJUSTMENT

Adjustment Points

Adjustment Procedure

Adjustment of clock frequency

1. Short-circuit the IC401 side of R412 ~ R415 and connect it to the jumper (+5V) near IC401 pin 40 (or short circuit IC401 pins 14 ~ 17, and connect it to pin 39).
2. Connect the oscilloscope to the anode side of D401 (or IC401 pin 4).
3. Turn the power switch on.
4. Adjust VR401 so that the period of waveform is $30 \pm 1 \mu\text{sec}$.

Adjustment of offset voltage

1. Connect the DC voltmeter or oscilloscope to TP201 and the plus (+) side of C203 (or connect it to IC301 pins 1 and 8).
2. Turn the power switch on.
3. Adjust VR201 so that DC voltage is $0 \pm 20 \text{ mV}$.
If the voltage fluctuates, adjust it to minimize the fluctuation.

Note: Put the set on a horizontal table and clamp the arm when making the adjustment.

Adjustment of arm lift height

The arm-lift height (distance between the stylus tip and the record surface when the tonearm is at the "▼" position) has been adjusted at the factory to approximately 5 to 7 mm (3/16" ~ 9/32").

If the clearance is too narrow or too wide, turn the adjustment screw clockwise or counterclockwise.

Clockwise rotation

—distance between the record and stylus tip is decreased.

Counterclockwise rotation

—distance between the record and stylus tip is increased.

Adjustment of auto start position

If the stylus does not land in the lead-in groove, adjust as follows.

1. Clamp the tonearm to the arm rest.
2. Remove the rubber cap.
3. Turn the auto-start adjustment screw with a screwdriver, clockwise or counterclockwise as necessary.

If the stylus tip sets down too far in the recorded groove,
—turn counterclockwise.

If the stylus tip sets down outside of the record,
—turn clockwise.

Adjust so the stylus tip lands 1 ~ 2 mm in from the edge of the record.

■ HOW TO CHECK EACH CIRCUIT

● Control circuit

Ref. No. 1	Check of stop mode	Ref. No. 2	Check of arm drive
Procedure 1	1. Clamp the tonearm and remove the turntable platter. 2. Remove the bottom plate. 3. Turn the power switch on.  Control circuit board	Procedure 1 ➡ 2	1. Put the set on the repair table. 2. Fit the stylus cover to the cartridge. 3. Unclamp the tonearm. 4. Turn the power switch on, then press the search key and cueing key. Note: In this condition, the start stop key does not work. 5. Connect the tester from underneath the set, and check.  Repair table
Ref. No. 3	Check of auto start/return		
Procedure 1 ➡ 2 ➡ 3	1. Fit the turntable platter in place. 2. Put a 30 cm or 17 cm record on the turntable platter. 3. Remove the stylus cover. 4. Turn the power switch on and press the start key. 5. Connect the tester from underneath the set, and check. * If no record is available, shift the turntable platter sheet from the hole provided for the sensor to cover it or cover the light receiving port of the sensor located beside the tonearm with a black tape. This procedure will substitute for a 30 cm record.	 Record Light receiving part	

• Turntable drive circuit

Ref. No. 4	Check of stop mode
Procedure 1 ⇒ 4	1. Remove the connectors FCN302, FCN303 and FCN503 of control circuit. 2. Remove the control circuit board setscrews ① ~ ⑤ and earth lead setscrews ⑥. 3. Connect the earth lead to the stator frame. 4. Turn the power switch on with care not to short-circuit the control circuit board.
	
Ref. No. 5	Check of rotation mode
Procedure 1 ⇒ 4 ⇒ 5	1. Put the set on the repair table. 2. Fit the turntable platter in place. 3. Turn the power switch on with care not to short-circuit the control circuit board. 4. Press the start key. 5. Connect the tester from underneath the set, and check. *The indication is incorrect because the detection input connector of microcomputer is disconnected. Also, the power indicator keeps lighting when power switch is pressed again, and then the start key does not work. In that case, pull out the power cord plug and turn the power switch on again.
	

• Arm drive coil circuit

■ TECHNICAL GUIDE

This unit is equipped with an electronic drive arm employing unique DD arm drive motor mechanism in which the newly developed vertical and horizontal drive motors are unistructurally included. It ensures smoother operation without applying load to the arm and cartridge during auto lead-in or auto return as compared with a mechanism type.

Also, infrared detection system is employed for the detection of record and size, and while non-contact type auto mechanism utilizing magnetic characteristics, for the detection of record ends.

System Block Diagram

● Schematic diagram of electronic drive arm

1. Power supply control circuit

With the AC cord connected to a power outlet socket, a voltage is generated at point ①, and then over 0.6V is applied to the base of Q1 to turn it on. As Q1 is turned on, the base of Q1 is nearly at ground potential causing Q2 to turn off and then no output voltage is generated. (Initial condition)

When S601 (power switch) is turned on, the voltage at point ② is clamped at about 0.6V, and the base voltage of Q1 becomes lower than 0.6V, then Q1 turns off. As Q1 is off, the base voltage is applied to Q2 to turn it on. Thus, Q3 and Q4 are operated to supply power of 12V and 5V.

The 5V power supply causes the microcomputer to operate, then the level of terminal ②⑤ becomes "L" and the voltage at point ② is lowered to the ground potential through Q405, thereby holding Q1 in an "off" state.

With S601 (power switch) again turned on, the pulse rising at the moment when the switch is released is input to terminal ①⑧ of the microcomputer, then the level of terminal ②⑤ becomes "H", Q405 turns off, the potential at point ② becomes higher, Q1 turns on, and delivery of output voltage is discontinued.

Note: Terminal ②⑤ of microcomputer is provided with a safety function to shift the arm back to the rest and to make the level "H" after cueing down for the protection of stylus tip when the arm is not on the rest.

2. Auto size detection circuit

The 2 LED's light up with 180° phase shifted pulses of pin ⑧ and pin ⑨ of microcomputer (IC401) and are fitted on the inner and outer periphery sides of turntable platter. On the inner periphery side, the light is received through prism, and on the outer periphery side, directly by photo transistor (PTR501).

The light received is input to pin ①⑨ through the filter amplifier and wave shaping circuit.

The LED ON-timing and input pulse of pin ⑱ are shown below.

No record is present. The light of 2 LED's is input.

17 cm record is present. The light of only outer periphery LED (D405) is input.

30 cm record is present. No light of LED is input.

The microcomputer detects the sizes of record by the operations mentioned above.

3. Arm position detection circuit

The rest position, 30 cm record, 17 cm record lead-in position and return area are detected by the slit plate and optical detection element located under the tonearm, and the input is entered into the microcomputer.

The optical detection element (PC501) is equipped with 2 detection elements (A) and (B).

When the tonearm is on the rest, the slit plate is in the position as shown on the right, then both detection elements (A) and (B) are "on", and microcomputer pins ⑳ and ㉑ are at "H".

At the outer periphery (lead-in position) of 30 cm record, the slit plate is in the position as shown on the right, the detection element (A) is "off" and (B) is "on", then microcomputer pin ㉑ goes "L" and pin ㉒, "H".

Also, for the outer periphery position of 17 cm record, the states are the same as above.

In the range of tonearm return, the slit plate is in the position shown on the right, the detection element (A) is "on" and (B) is "off", then microcomputer pin ㉑ goes "H" and pin ㉒, "L".

In the other modes (lead-in, return operation, play modes), both detection elements (A) and (B) are "off", then microcomputer pins ㉑ and ㉒ are at "L".

4. Vertical control circuit

< Operating principle >

When a magnetic field is created by a disk magnet of arm drive DD motor, thereby letting a current flow in the coil wound in a circular form, then vertical forces are generated in either direction (Fleming's left-hand rule). Since the coil is secured on the main body, the magnet rotates on the fulcrum in the direction of the arrow due to the reaction. The rotation is utilized for cueing operation.

< Vertical drive circuit >

During cueing-up, microcomputer (IC401) pin ⑦ goes "L" and Q304 turns "off", then the potential of comparator (IC301) pin ⑬ rises to become $\ominus > \oplus$ and the output of pin ⑭ becomes "-". As pin ⑭ is "-", Q301 turns "on" to apply voltage to the drive coil.

When voltage is applied to the drive coil, the magnet begins rotating (vertically) causing voltage to be generated in the detection coil. The voltage is input to comparator pin ⑫ through the amplifier thereby applying vertical drive servo.

During cueing-down, microcomputer (IC401) pin ⑦ goes "H" and Q304 turns "on", then the potential of comparator (IC301) pin ⑬ lowers to become $\oplus > \ominus$ and the output of pin ⑭ becomes "+". As pin ⑭ is "+", Q301 turns "off" for a moment, causing the voltage of drive coil to drop abruptly.

When the voltage of drive coil is decreased, the magnet begins to rotate downward, but is slowly returns with servo applied due to the voltage generated in the detection coil.

< Stylus position detection >

Since the cueing speed is controlled as mentioned above, the voltage applied to the drive coil changes as illustrated on the right according to the load in cueing mode. The position of the stylus on or off the disc is detected by the voltage for the operation of brake (to prevent the stylus from dropping aslant) and muting.

5. Horizontal control circuit

< Horizontal drive circuit >

In free mode (with arm on rest), microcomputer (IC401) pin ⑫ is "H", pin ⑬ "pulse output", pin ⑭ "L", then Q209 turns "on", Q201 "off", Q205 "off", and analog switch (S1) is "on". (IC401 pin ③ goes "H" only in play mode, and analog switch S2 is "off".) In this case, the voltage V_o across the horizontal drive coil is "0".

During lead-in mode, microcomputer (IC401) pin ⑫ goes "L", pin ⑬ "H", pin ⑭ "L", then Q209 turns "off", Q201 "on", Q205 "off", and analog switch (S1) is "on". Also, speed (rotational direction) command voltage V_s is output to IC201 pin ⑭. (V_s is about 4V when IC401 pin ⑬ is at "H", and about 8V at "L".)

Due to the voltage of V_s , the voltage across the drive coil instantaneously changes from "0" to plus (+) voltage causing the magnet to start rotating. Then a voltage is generated in the detection coil, and the voltage is amplified to apply servo to the horizontal drive circuit. V_o is almost zero while servo is applied to the circuit.

In return mode, microcomputer (IC401) pin ⑬ goes "L" and the speed command voltage V_s becomes higher than in lead-in mode (about 8V), and the voltage across the drive coil instantaneously changes from "0" to minus (-) voltage. The magnet starts rotating in the reverse direction causing a voltage to be generated in the detection coil. The voltage is amplified to apply servo to the horizontal drive circuit.

< Anti-skating >

In play mode, microcomputer (IC401) pin ⑫ goes "H", pin ⑬ "pulse output", pin ⑭ "H", then Q209 turns "on", Q201 "off", Q205 "on", and analog switch (S1) is "off", then IC401 pin ③ goes "H", Q212 "on", Q211 "off", and analog switch S2 is "on".

That is, the servo circuit by the detection coil becomes open, then only the horizontal drive circuit consisting of IC203 and VR303 is in operation. The voltage V_x of VR303 and voltage V_o across the drive coil change linearly to V_x therefore voltage V_o is applied to the drive coil according to the variation of VR303 for the purpose of anti-skating.

5. Horizontal control circuit

< Horizontal drive circuit >

In free mode (with arm on rest), microcomputer (IC401) pin 22 is "H", pin 23 "pulse output", pin 24 "L", then Q209 turns "on", Q201 "off", Q205 "off", and analog switch (S1) is "on". (IC401 pin 3 goes "H" only in play mode, and analog switch S2 is "off".) In this case, the voltage Vo across the horizontal drive coil is "0".

During lead-in mode, microcomputer (IC401) pin 22 goes "L", pin 23 "H", pin 24 "L", then Q209 turns "off", Q201 "on", Q205 "off", and analog switch (S1) is "on". Also, speed (rotational direction) command voltage Vs is output to IC201 pin 14. (Vs is about 4V when IC401 pin 23 is at "H", and about 8V at "L".)

Due to the voltage of Vs, the voltage across the drive coil instantaneously changes from "0" to plus (+) voltage causing the magnet to start rotating. Then a voltage is generated in the detection coil, and the voltage is amplified to apply servo to the horizontal drive circuit. Vo is almost zero while servo is applied to the circuit.

In return mode, microcomputer (IC401) pin 23 goes "L" and the speed command voltage Vs becomes higher than in lead-in mode (about 8V), and the voltage across the drive coil instantaneously changes from "0" to minus (-) voltage. The magnet starts rotating in the reverse direction causing a voltage to be generated in the detection coil. The voltage is amplified to apply servo to the horizontal drive circuit.

< Anti-skating >

In play mode, microcomputer (IC401) pin 22 goes "H", pin 23 "pulse output", pin 24 "H", then Q209 turns "on", Q201 "off", Q205 "on", and analog switch (S1) is "off", then IC401 pin 3 goes "H", Q212 "on", Q211 "off", and analog switch S2 is "on".

That is, the servo circuit by the detection coil becomes open, then only the horizontal drive circuit consisting of IC203 and VR303 is in operation. The voltage Vx of VR303 and voltage Vo across the drive coil change linearly to Vx, therefore voltage Vo is applied to the drive coil according to the variation of VR303 for the purpose of anti-skating.

< End detection circuit >

Immediately after power "on", the microcomputer pins 4 and 5 delivers the outputs at the timing as shown on the right. The output causes S3 to be shifted to R side, and the voltage is read into microcomputer pin 29. The value is the initial value. (Reading is finished in about 1 sec.)

* Shifting it to R in the initial read mode is intended to avoid the influence of external vibration of the detection coil, then the resistance values of the coil and R are equal to each other.

After completion of read, S3 is shifted to the detection coil side. In play mode, the change in voltage of the detection coil (inverse electromotive voltage) caused by the movement of the magnet is detected at 150° interval during a turn of the turntable platter, and the input is entered into microcomputer pin 29.

When the slit plate under the tonearm comes to the return area, the microcomputer detects the end through comparison between the initial value and the inverse electromotive voltage of detection coil.

■ REPLACEMENT PARTS LIST

- Notes:**
1. Part numbers are indicated on most mechanical parts.
Please use this part number for parts orders.
 2. Important safety notice:
Components identified by  mark have special characteristics important for safety.
When replacing any of these components use only manufacturer's specified parts.
 3. Bracketed indications in Ref. No. columns specify the area.
Parts without these indications can be used for all areas.
 4. The "S" mark is service standard parts and may differ from production parts.
 5. The parenthesized numbers in the columns of description stand for the quantity per set.

■ CIRCUIT BOARDS AND WIRING CONNECTION DIAGRAM

*** Caution !**
IC and LSI are sensitive to static electricity.
Secondary trouble can be prevented by taking care during repair.

- * Cover the parts boxes made of plastics with aluminum foil.
- * Ground the soldering iron.
- * Put a conductive mat on the work table.
- * Do not touch the legs of IC or LSI with the fingers directly.

■ SCHEMATIC DIAGRAM

(This schematic diagram may be modified at any time with the development of new technology.)

Notes:

1. **S601** : Power switch.
2. **S602** : Start · Stop switch.
3. **S603** : Cueing switch.
4. **S604, S605** : Forward search switch.
5. **S606, S607** : Backward search switch.
6. **S608** : Speed selector switch.
7. **S609** : Repeat switch.
8. The voltage value and waveform are the standard values of this measured by DC electronic voltmeter (high impedance) and oscilloscope on the basis of chassis. Therefore, the voltage value and waveform may included some error due to the internal impedance of the tester or the measuring unit.
 - * is the voltage when turntable is stop.
 - * is the voltage when turntable is in rotation.
 - * is the voltage when tonearm is in lead-in mode.
 - * is the voltage when tonearm is in return mode.
9. Positive voltage lines.
10. Important safety notice:
Components identified by mark have special characteristics important for safety. When replacing any of these components, use only manufacturer's specified parts.

* The part No. of transistor, IC and diodes mentioned in the schematic diagram stand for production part.No. Regarding the part No. with mark the production part No. are different from the replacement part No. Therefore, when placing an order for replacement part, please use the part No. in the replacement parts list.

■ POWER SOURCE CIRCUIT

Important safety notice:
Components identified by  mark have special characteristics important for safety.
When replacing any of these components, use only manufacturer's specified parts.

● Product for U.S.A.

● Product for Canada

● Product for MC only

FUSE REPLACEMENT

 Symbol located near the fuse indicates fast operating type. For continued protection against fire hazard, replace with same type fuse. Refer to the symbol for fuse rating.

FUSIBLE REMPLACEMENT

 Le symbole qui se trouve près du fusible signifie un fusible à action rapide. Pour une protection continue contre les risques d'incendie, n'utiliser que des fusibles du même type. Se rapporter au symbole pour la valeur des fusibles.

● Product for Others

Note:

S901 : Voltage selector.
in "220 ~ 240V" position.
110 ~ 127V ↔ 220 ~ 240V

RESISTORS and CAPACITORS

Notes: 1. Part numbers are indicated on most mechanical parts. Please use this part number for parts orders.
2. Important safety notice:
Components identified by Δ mark have special characteristics important for safety. When replacing any of these components use only manufacturer's specified parts.

3. The "S" mark is service standard parts and may differ from production parts.
4. Unless otherwise specified.
All resistors are in OHMS (Ω), K = 1000 Ω , M = 1000k Ω .
All capacitors are in MICROFARADS (μ F), P = 10⁻⁶ μ F.

Numbering System of Resistor

Example

ERD	25	F	J	101
Type	Wattage (1/4W)	Shape	Tolerance	Value (100 Ω)
ERD	1	AN	J	2R2
Type	Wattage (1W)	Shape	Tolerance	Value (2.2 Ω)

Numbering System of Capacitor

Example

ECKD	1H	102	Z	F
Type	Voltage (50V)	Value (0.001 μ F)	Tolerance	Peculiarity
ECEA	50	M	R47	R
Type	Voltage (50V)	Peculiarity use	Value (0.47 μ F)	Special use

Resistor Type	Wattage	Tolerance
ERD : Carbon	S2 : 1/4W	J : $\pm$ 5%
ERO : Metal Film	1 : 1W	G : $\pm$ 2%
ERG : Metal Oxide	2 : 2W	
ERX : Metal Film		

Capacitor Type	Voltage		Tolerance
	ECEA Type	Others	
ECEA : Electrolytic	0J : 6.3V	1H : 50V DC	J : $\pm$ 5%
ECEA...N : Non Polar	1A : 10V	05 : 50V	K : $\pm$ 10%
Electrolytic	1C : 16V	1 : 100V	Z : +80%, -20%
ECFR : Ceramic	1E : 25V		
ECQM : Polyester	1V : 35V		
ECCD : Ceramic	1H : 50V		
ECQV : TF	50 : 50V

PACKING

1. Fit the packing materials in the order of ① ~ ④.

Cautions
Be sure to keep the following points when packing or re-transporting the unit.
1. Completely insert the clamp spacer.
2. Set the pipe in place.
3. Fit the washer to the setscrew and fasten the pipe with the screw. (Do not fasten it with the screw before inserting the clamp spacer. Otherwise the tonearm may be damaged.)

2. Put the unit into polyethylene bag, and make the package as shown below.

3. Place the unit (with cushions attached) as illustrated.
4. Fold the flaps according to the line marks.
5. Seal the top with adhesive tape.
* Use gum tape or adhesive cloth tape of 50mm wide at least.
6. For the edges, first fold the flap "a" and then flap "b", and staple. Remember to staple only flap "b". (Use 15 or 16mm staple)

* Stapling positions are shown below.

QUARTZ Direct Drive Automatic Turntable System

SL-MA1

- This booklet contains specifications and adjustment of Model SL—MA1 (Order No. HAD85052536C0) written in German, French and Spanish.
- File this booklet together with the service manual of Model SL—MA1.
- Dieses Broschüre die technischen Daten und Justierungsanleitungen von Modell SL—MA1 (Bestell-Nr. HAD85052536C0) in den Sprachen Deutsch, Französisch und Spanisch.
- Bewahren Sie dieses Büchlein zusammen mit dem Service-Handbuch von Modell SL—MA1 auf.
- Cette brochure contient les spécifications et la mise au point du Modèle SL—MA1 (N° d'Ordre HAD85052536C0) écrites en allemand, en français et en espagnol.
- Classer cette brochure en même temps qu'avec le manuel de service du N° du Modèle SL—MA1.
- Este librito contiene las especificaciones de y ajuste Modelo SL—MA1 (Pedido N° HAD85052536C0) escritas en alemán, francés y español.
- Guardar este librito juntamente con el manual de servicio de Modelo SL—MA1.

DEUTSCH

■ TECHNISCHE DATEN

(DIN 45 500)

■ Plattenteller

Typ:	Vollautomatischer Plattenspieler mit Quarz-Direktantrieb
Eigenschaften:	Auto-Start/Auto-Zuführung Rückführautomatik Stopautomatik Wiederholtes Abspielen Suchabspiel mit 2 Geschwindigkeiten
Antrieb:	Direktantrieb
Motor:	Kollektorloser Gleichstrommotor
Antriebsregelmethode:	Phasenverriegelte Quarzsteuerung
Plattenteller:	Aluminium-Druckguß Durchmesser 32,5 cm
Plattenteller-Drehzahlen:	33-1/3 und 45 U./min. Automatische Drehzahlwahl (manuelle Wahl möglich)
Gleichlaufschwankungen:	0,012% WRMS* 0,025% WRMS (JIS C5521) ±0,031% Spitze (IEC 98A bewertet)
* Gemessen anhand von Signalen vom eingebauten Frequenzgenerator des Motorteils.	
Rumpeln:	−70 dB (IEC 98A unbewertet) −81 dB (IEC 98A bewertet)

■ Tonarm

Typ:	Linearabtastungs-Tonarm mit 4-Punkt-Kardanaufhängung, statisch balanciert
-------------	---

Effektive Länge:	23 cm
Spurfehlwinkel:	Innerhalb 2°32' an der Einlaufrille einer 30 cm-Schallplatte Innerhalb 0°32' an der inneren Rille einer 30 cm-Schallplatte
Effektive Masse:	9 g (einschließlich Tonabnehmer)
Resonanzfrequenz:	10 Hz
Tonarm-Antriebsmotor:	Gleichstrommotor
Phonokabel-Kapazität:	100 pF

■ Tonabnehmer

Typ:	Beweglicher Magnet-Stereo-Tonabnehmer TD
Magnetkreis:	Ganzlamellenkern
Frequenzgang:	10 Hz bis 50 kHz 20 Hz bis 10 kHz ±1 dB 2,5 mV bei 1 kHz
Ausgangsspannung:	5 cm/s. Null-zu-Spitze, lateral [7 mV bei 1 kHz 10 cm/s. Null-zu-Spitze, 45° (DIN 45 500)]
Kanaltrennung:	22 dB bei 1 kHz
Kanalabweichung:	Innerhalb 1,8 dB bei 1 kHz
Empfohlene Endimpedanz:	47 kΩ~100 kΩ
Nachgiebigkeit (dynamisch):	12×10 ⁻⁶ cm/dyn bei 100 Hz
Nadeldruckbereich:	1,25±0,25 g (12,5±2,5 mN)
Gewicht:	6 g (nur Tonabnehmer)
Ersatznadel:	EPS-33ES (elliptisch)

■ Allgemeine Daten

Stromversorgung: ~110-127/220-240V,
50 oder 60 Hz

Leistungsaufnahme: 18 W/2 W
(Wenn nur der Strom
ausgeschaltet wird, verbraucht
das Gerät 2 W.)

Abmessungen:
(B×H×T)

45,3 × 17 × 40,8 cm
(Maximale Höhe bei vollständig
geöffnetem Gehäuseoberteil)
45,3 × 52 × 60 cm
9 kg

Gewicht:

Änderungen der technischen Daten vorbehalten.
Die angegebenen Gewichts- und Abmessungsdaten sind
ungefähre Werte.

■ MESSUNGEN UND JUSTIERUNGEN

Justierung der Taktfrequenz

1. Die IC401-Seite von R412 ~ R415 kurzschließen und an den Schalterdraht (+5V) in der Nähe von IC401, Stift 40 verbinden (oder IC401, Stifte 14 ~ 17 kurzschließen und mit Stift 39 verbinden).
2. Das Oszilloskop an die Anodenseite von D401 (oder IC401, Stift 4) anschließen.
3. Den Ein-/Aus-Schalter einschalten.
4. VR401 so justieren, daß die Periode der Wellenform $30 \pm 1 \mu\text{sec}$ beträgt.

Justierung der Offset-Spannung

1. Das Gleichstrom-Voltmeter oder Oszilloskop an TP201 anschließen und die Plus-Seite (+) von C203 (oder diese an IC201, Stift 1 und 8) anschließen.
2. Den Ein-/Aus-Schalter einschalten.
3. VR201 so justieren, daß die Gleichspannung $0 \pm 20 \text{ mV}$ beträgt. Wenn die Spannung schwankt, so ist diese Schwankung durch Justieren so gering wie möglich zu machen.

Anmerkung: Das Gerät auf eine horizontale Oberfläche stellen und den Arm auf der Tonarmablage festklemmen, um die Justierung durchzuführen.

Justierung der Tonarmlifthöhe

Die Tonarmlifthöhe, d.h. der Abstand zwischen Nadelspitze und Schallplattenoberfläche bei Liftsteuerungs-Position "▼", wurde werkseitig auf ca. 5 ~ 7 mm eingestellt.

Falls der Abstand zu klein oder zu groß ist (z.B. wegen der unterschiedlichen Tonabnehmer-Abmessungen, drehen Sie die Justierschraube im Uhrzeigersinn oder entgegen dem Uhrzeigersinn.

Drehung im Uhrzeigersinn

— Der Abstand zwischen der Platte und der Nadelspitze wird kleiner.

Drehung entgegen dem Uhrzeigersinn

— Der Abstand zwischen der Platte und der Nadelspitze wird größer.

Justierung des Aufsetzpunktes der Automatik

Wenn der Tonarm in der Nähe der Plattenmitte ist, so ist die Auto-Rückkehr-Justierschraube sichtbar.

Wenn die Abtastnadel nicht in der Einlaufrille aufsetzt, justieren Sie wie folgt.

1. Befestigen Sie den Tonarm mit der Arretierklammer auf der Tonarmablage.
 2. Nehmen Sie die Gummikappe von der Auto-Start-Positions-Justierschraube ab.
 3. Drehen Sie die Justierschraube im Uhrzeigersinn oder entgegen dem Uhrzeigersinn, wie erforderlich.
- Falls der Aufsetzpunkt im Wiedergabeteil der Schallplatte liegt.

— **Entgegen dem Uhrzeigersinn drehen.**

Falls der Aufsetzpunkt außerhalb der Platte liegt.

— **Im Uhrzeigersinn drehen.**

Justieren Sie so, daß die Nadelspitze 1 ~ 2 mm vom Rand entfernt auf der Platte aufsetzt.

FRANÇAIS

■ CARACTERISTIQUES

■ Platine de lecture

Type:	Entraînement direct par quartz Platine automatique
Caractéristiques:	Démarrage automatique/Entrée automatique, Sélection optique automatique du diamètre, Sélection optique automatique de la vitesse, Retour automatique/Arrêt automatique, Audition répétée, Lecture de recherche à 2 vitesses.
Système d'entraînement:	Entraînement direct
Moteur:	Moteur C.C. sans balai
Système de commande d'entraînement:	Régler d'accrochage de phase par quartz
Plateau de lecture:	Aluminium moulé sous pression Diamètre 32,5 cm
Vitesses de la platine:	33-1/3 et 45 t/p.m. Sélecteur de vitesse automatique (Sélection manuelle possible)
Pleurage et scintillement:	0,012% de valeur efficace* 0,025% de valeur efficace (JIS C5521) ±0,031% de crête (IEC 98A pondéré)
Ronflement:	*Mesuré par l'obtention d'un signal provenant du générateur de fréquences incorporé de l'ensemble du moteur. -70 dB (IEC 98A non pondéré) -81 dB (IEC 98A pondéré)

■ Bras de lecture

Type:	Bras de lecture tubulaire rectiligne de type statiquement équilibré avec suspension à la cardan sur 4 pivots
Caractéristiques:	Electroniquement contrôlé Entrée automatique/Retour automatique
Longueur effective:	23 cm
Erreur d'angle d'alignement:	En deçà de 2°32' au sillon extérieur d'un disque de 30 cm (12 pouces) En deçà de 0°32' au sillon intérieur d'un disque de 30 cm (12 pouces)

Masse réelle:	9 g (y compris la cellule pick-up)
Fréquence de résonance:	10 Hz
Moteur d'entraînement du bras de lecture:	Moteur C.C. sans balai
Capacité du câble phono:	100 pF
Plage de la force verticale d'appui:	1,25 ± 0,25 g (12,5 ± 2,5 mN)

■ Cellule pick-up

No du modèle:	EPC-P33
Type:	Cellule pick-up stéréo à aimant mobile 
Circuit magnétique:	Noyau entièrement feuilleté
Réponse en fréquence:	10 Hz à 50 kHz 20 Hz à 10 kHz ± 1 dB
Tension de sortie:	2,5 mV à 1 kHz; 5 cm/s. Zéro à vitesse latérale de crête (7 mV à 1 kHz; 10 cm/s. Zéro à vitesse 45° de crête [DIN 45 500])
Séparation des canaux:	22 dB à 1 kHz
Équilibrage des canaux:	En deçà de 1,8 dB à 1 kHz
Impédance de charge recommandée:	47 kΩ~100 kΩ
Elasticité (dynamique):	12×10 ⁻⁶ cm/dyne à 100 Hz
Plage de la force verticale d'appui:	1,25±0,25 g (12,5±2,5 mN)
Poids:	6 g (cellule seule)
Remplacement de la pointe de lecture:	EPS-33ES (ellipsoïdale)

■ Généralités

Alimentation:	~110-127/220-240V, 50 ou 60 Hz
Consommation:	18 W/2 W avec l'interrupteur d'alimentation mis hors circuit
Dimensions: (L × H × P)	45,3 × 17 × 40,8 cm Hauteur maximum lorsque le couvercle protège-poussière est ouvert: 45,3 × 52 × 60 cm.
Poids:	9 kg

Les spécifications sont susceptibles d'être modifiées sans avertissement préalable.
Le poids et les dimensions donnés sont approximatifs.

■ MESURAGES ET RÉGLAGES

Réglage de la fréquence d'horloge

1. Court-circuiter le côté IC401 de R412 ~ R415 et le raccorder à la bretelle (+5V) de la broche 40 de IC401 (ou court-circuiter les broches 14 ~ 17 de IC401, et le raccorde à la broche 39).
2. Brancher l'oscilloscope au côté de l'anode de D401 (ou de la broche 4 de IC401).
3. Mettre en circuit l'interrupteur d'alimentation.
4. Régler VR401 de telle sorte que la durée de la forme d'onde soit de $30 \pm 1 \mu\text{sec}$.

Réglage de la tension de décalage

1. Raccorder le voltmètre à C.C. ou l'oscilloscope à TP201 et au côté positif (+) de C203 (ou le raccorder aux broches 1 et 8 de IC201).
2. Mettre en circuit l'interrupteur d'alimentation.
3. Régler VR201 de telle sorte que la tension C.C. soit de $0 \pm 20 \text{ mV}$.
Si la tension varie, la régler pour minimiser la variation.

Nota: Placer l'appareil sur une table horizontale et bloquer le bras lorsque l'on effectue la mise au point.

Mise au point de la hauteur de l'élévateur du bras

La hauteur de l'élévateur du bras (distance entre l'extrémité de la pointe de lecture et la surface du disque, lorsque la commande de pose et de relevage est à la position "▼") a été réglée en usine sur approximativement 5 à 7 mm. Si l'écartement est trop étroit ou trop large, tourner la vis de réglage dans le sens des aiguilles d'une montre ou dans le sens contraire.

Rotation dans le sens des aiguilles d'une montre.

— La distance entre la surface du disque et l'extrémité de la pointe de lecture diminue.

Rotation dans le sens contraire des aiguilles d'une montre.

— La distance entre la surface du disque et l'extrémité de la pointe de lecture augmente.

Mise au point de la position de d'emarrage automatique

Si la pointe de lecture ne repose pas dans le sillon d'entrée, ajuster de la manière suivante.

1. Bloquer le bras de lecture sur le support du bras.
2. Retirer le capuchon en caoutchouc.
3. Avec un tournevis, tourner la vis de réglage dans le sens des aiguilles d'une montre ou dans le sens inverse selon la nécessité.

Si la tête de la pointe de lecture se dépose trop loin du sillon enregistré,

— tourner dans le sens contraire des aiguilles d'une montre.

Si la tête de la pointe de lecture se dépose en dehors du disque,

— tourner dans le sens des aiguilles d'une montre.

Ajuster de façon à ce que l'extrémité de la pointe de lecture atterrisse à 1 ~ 2 mm à partir du bord du disque.

ESPAÑOL

MEDICIONES Y AJUSTE

ESPECIFICACIONES

Sección del plato giratorio

Tipo: Plato giratorio automático con accionamiento directo por cuarzo

Ventajas: Arranque/descenso automáticos
Selección óptica automática del tamaño
Selección óptica automática de la velocidad
Retorno/parada automáticos
Ejecución repetida
Ejecución con búsqueda con 2 velocidades

Método de accionamiento: Accionamiento directo

Motor: Motor de corriente continua sin escobillas

Método de control de accionamiento: Control enclavado de fase de cuarzo

Platillo del plato giratorio: Aluminio fundido
32,5 cm de diámetro

Velocidades del plato giratorio: 33-1/3 y 45 rpm
Selección automática de la velocidad
(También posibilidad de seleccionar a mano)

Ululaciones y trémolo: 0,012% WRMS*
0,025% WRMS (JIS C5521)
±0,031% cresta
(IEC 98A Ponderado)

*Medido obteniendo una señal proveniente del generador de frecuencias incorporado del conjunto del motor.

Ruido de rodadura: -70 dB (IEC 98A No ponderado)
-81 dB (IEC 98A Ponderado)

Sección del brazo sonoro

Tipo: Brazo sonoro con tubo recto estáticamente equilibrado, suspensión cardánica de 4 pivotes

Ventajas: Descenso/retorno automáticos electrónicamente controlados
23 cm

Longitud efectiva: Inferior a 2°32' en el surco exterior de un disco de 30 cm (12")
Inferior a 0°32' en el surco interior de un disco de 30 cm (12")

Masa efectiva: 9 g (incluyendo el cartucho)

Frecuencia de resonancia: 10 Hz

Motor de accionamiento del brazo sonoro: Motor de corriente continua sin escobillas

Capitancia del cable del fonógrafo: 100 pF

Radio de presión de la aguja: 1,25 ±0,25 g

Sección del cartucho

Núm. del model: EPC-P33

Tipo: Cartucho estereofónico de imán móvil 

Circuito magnético: Núcleo totalmente laminado

Respuesta de frecuencia: 10 Hz a 50 kHz
20 Hz a 10 kHz ±1 dB
2,5 mV a 1 kHz
Velocidad lateral de cero a cresta de 5 cm/s
(7 mV a 1 kHz, Velocidad de 45° de cero a cresta de 10 cm/s [DIN 45 500])

Voltaje de salida: 22 dB a 1 kHz
Inferior a 1,8 dB a 1 kHz

Separación de canales: 22 dB a 1 kHz

Equilibrio de canales: Inferior a 1,8 dB a 1 kHz

Impedancia de carga recomendada: 47 kΩ a 100 kΩ

Elasticidad (dinámica): 12×10⁻⁶cm/dina a 100 Hz

Radio de presión de la aguja: 1,25±0,25 g (12,5±2,5 mN)

Peso: 6 g (cartucho solamente)

Aguja de recambio: EPS-33ES (Aguja elíptica)

En general

Alimentación de corriente: ~110-127/220-240V, 50 ó 60 Hz

Consumo de corriente: 18 W/2 W con el interruptor de corriente apagado

Dimensiones: (Ancho×Alto×Prof.) 45,3 × 17 × 40,8 cm (Altura máxima cuando la tapa contra el polvo está abierta: 45,3 × 52 × 60 cm)

Peso: 9 kg

Las especificaciones quedan sujetas a cambios sin aviso previo.
Los pesos y las dimensiones son aproximativos.

Ajuste de frecuencia de reloj

1. Cortacircuite el lado de IC401 R412 ~ R415 y conéctelo al puente (+5V) cerca del pernos 40 de IC401 (o cortacircuite los pernos 14 ~ 17 de IC401, y conéctelo al perno 39).
2. Conecte el osciloscopio al lado del ánodo de D401 (o perno 4 de IC401).
3. Prenda el interruptor de alimentación.
4. Ajuste VR401 de manera que el periodo de forma de onda sea 30 ± 1 μseg.

Ajuste de voltaje de desnivel

1. Conecte el voltímetro de CC u osciloscopio a TP201 y el lado más (+) de C203 (o conéctelo a los pernos 1 y 8 de IC201).
2. Prenda el interruptor de alimentación.
3. Ajuste VR201 de manera que el voltaje de CC sea 0 ± 20 mV.
Si el voltaje fluctúa, ajústelo para minimizar la fluctuación.

Nota: Ponga el aparato sobre una mesa horizontal y fije el brazo al hacer el ajuste.

Ajuste de la altura de elevación del brazo

La altura de elevación del brazo (o sea, la distancia entre la punta de la aguja y la superficie del disco cuando el control de colocación está en la posición "▼") ha sido regulada en la fábrica aproximadamente entre 5 y 7 mm.
En caso que la distancia fuese demasiado abundante o demasiado escasa, girar el tornillo de ajuste hacia la derecha o hacia la izquierda.

Rotación hacia la derecha

— raduce la distancia entre el disco y la punta de la aguja.

Rotación hacia la izquierda

— aumenta la distancia entre el disco y la punta de la aguja.

Ajuste de la posición para el arranque automático

En caso que la aguja no se depositara en el surco de comienzo, regular de la manera que sigue.

1. Sujetar el brazo sonoro al apoyo del mismo con la grapa.
2. Quitar la tapita de goma.
3. Girar el tornillito de ajuste hacia la derecha o hacia la izquierda usando un destornillador, según sea necesario.

En caso que la punta de la aguja se deposita muy dentro del surco grabado:

— Girar hacia la izquierda.

En caso que la punta de la aguja se deposita fuera del disco:

— Girar hacia la derecha.

Regular de manera tal que la punta de la aguja se deposite a uno o dos milímetros del borde del disco.
