

TOSHIBA

STEREO CASSETTE DECK

PC-X88AD

SPECIFICATIONS

Heads:	Recording/playback: super AP combination head	Output terminals:	LINE OUT: 0.4V (50 kΩ)
Drive system:	Erase: dual-gap ferrite head	ENCODE OUT: 300mV (50 kΩ)	HEADPHONE: 0.4mW (8 Ω)
Motors:	2-motor IC logic control	Semiconductors:	20 ICs, 25 transistors, 10 FETs, 35 diodes, 9 LEDs
Capstan:	Capstan drive DC servo motor	Power supply:	AC 240V ~, 50 Hz (for the U.K. and Australia)
Reel:	Reel drive DC motor		AC 220V ~, 50Hz (for European Countries except the U.K.)
Wow & flutter:	0.035% WTD, RMS DIN ±0.14%		AC 120V ~, 50/60 Hz (for Canada)
FF and rewind time:	Approx. 80 seconds (C-60 tape)	Power consumption:	24W
Frequency response:		Major dimensions:	420(W) x 110(H) x 280(D)mm (including knobs and supports)
Metal tape:	20 Hz – 20,000 Hz	Weight:	4.8 kg
Chrome position tape:	20 Hz – 19,000 Hz	Accessories:	2 connecting cables (pin–pin) Head cleaner
Normal tape:	20 Hz – 17,000 Hz		
SN ratio:	60 dB (peak Level, WTD) (noise reduction OUT)		
THD:	0.3% (400 Hz) (adres IN)		
Bias frequency:	85 kHz		
Input terminals:			
MIC:	0.25mV (600Ω – 10kΩ)		
LINE IN:	70mV (50 kΩ)		
DECODE IN:	150mV (50 kΩ)		

Specification are subject to change without notice.

* Noise Reduction System is manufactured under license from Dolby Laboratories.
 "DOLBY" and the Double-D symbol are Trademarks of Dolby Laboratories Inc.

adres is the new noise-reduction and Automatic Dynamic Range Expansion System developed by TOSHIBA Corp., Tokyo, Japan

1. FEATURES

- **Three-head deck with recently developed combination record/playback head**
 The new super AP head developed by TOSHIBA features a unique tapered head shape to ensure that the recording head makes perfect head-to-tape contact for optimum recording performance.
- **Dual adres system for maximum quality of sound**
 The 4-channel adres circuit in this deck enables recordings to be monitored during the recording operation.
- **4-channel adres unit for expanded adres capacity**
 When connected to another tape deck, adres recording and playback in the other deck is also possible.
- **High-performance 2-motor IC logic mechanism**
- **Memory counter and auto repeat functions**
- **Adjustable recording and playback sensitivity**
- **Fine adjustment of recording bias**
- **Tape transport mode buttons with built-in indicator lamps**
- **Remote control unit connector terminal**
- **Recording mute for easier editing**

2. OPERATING CONTROLS

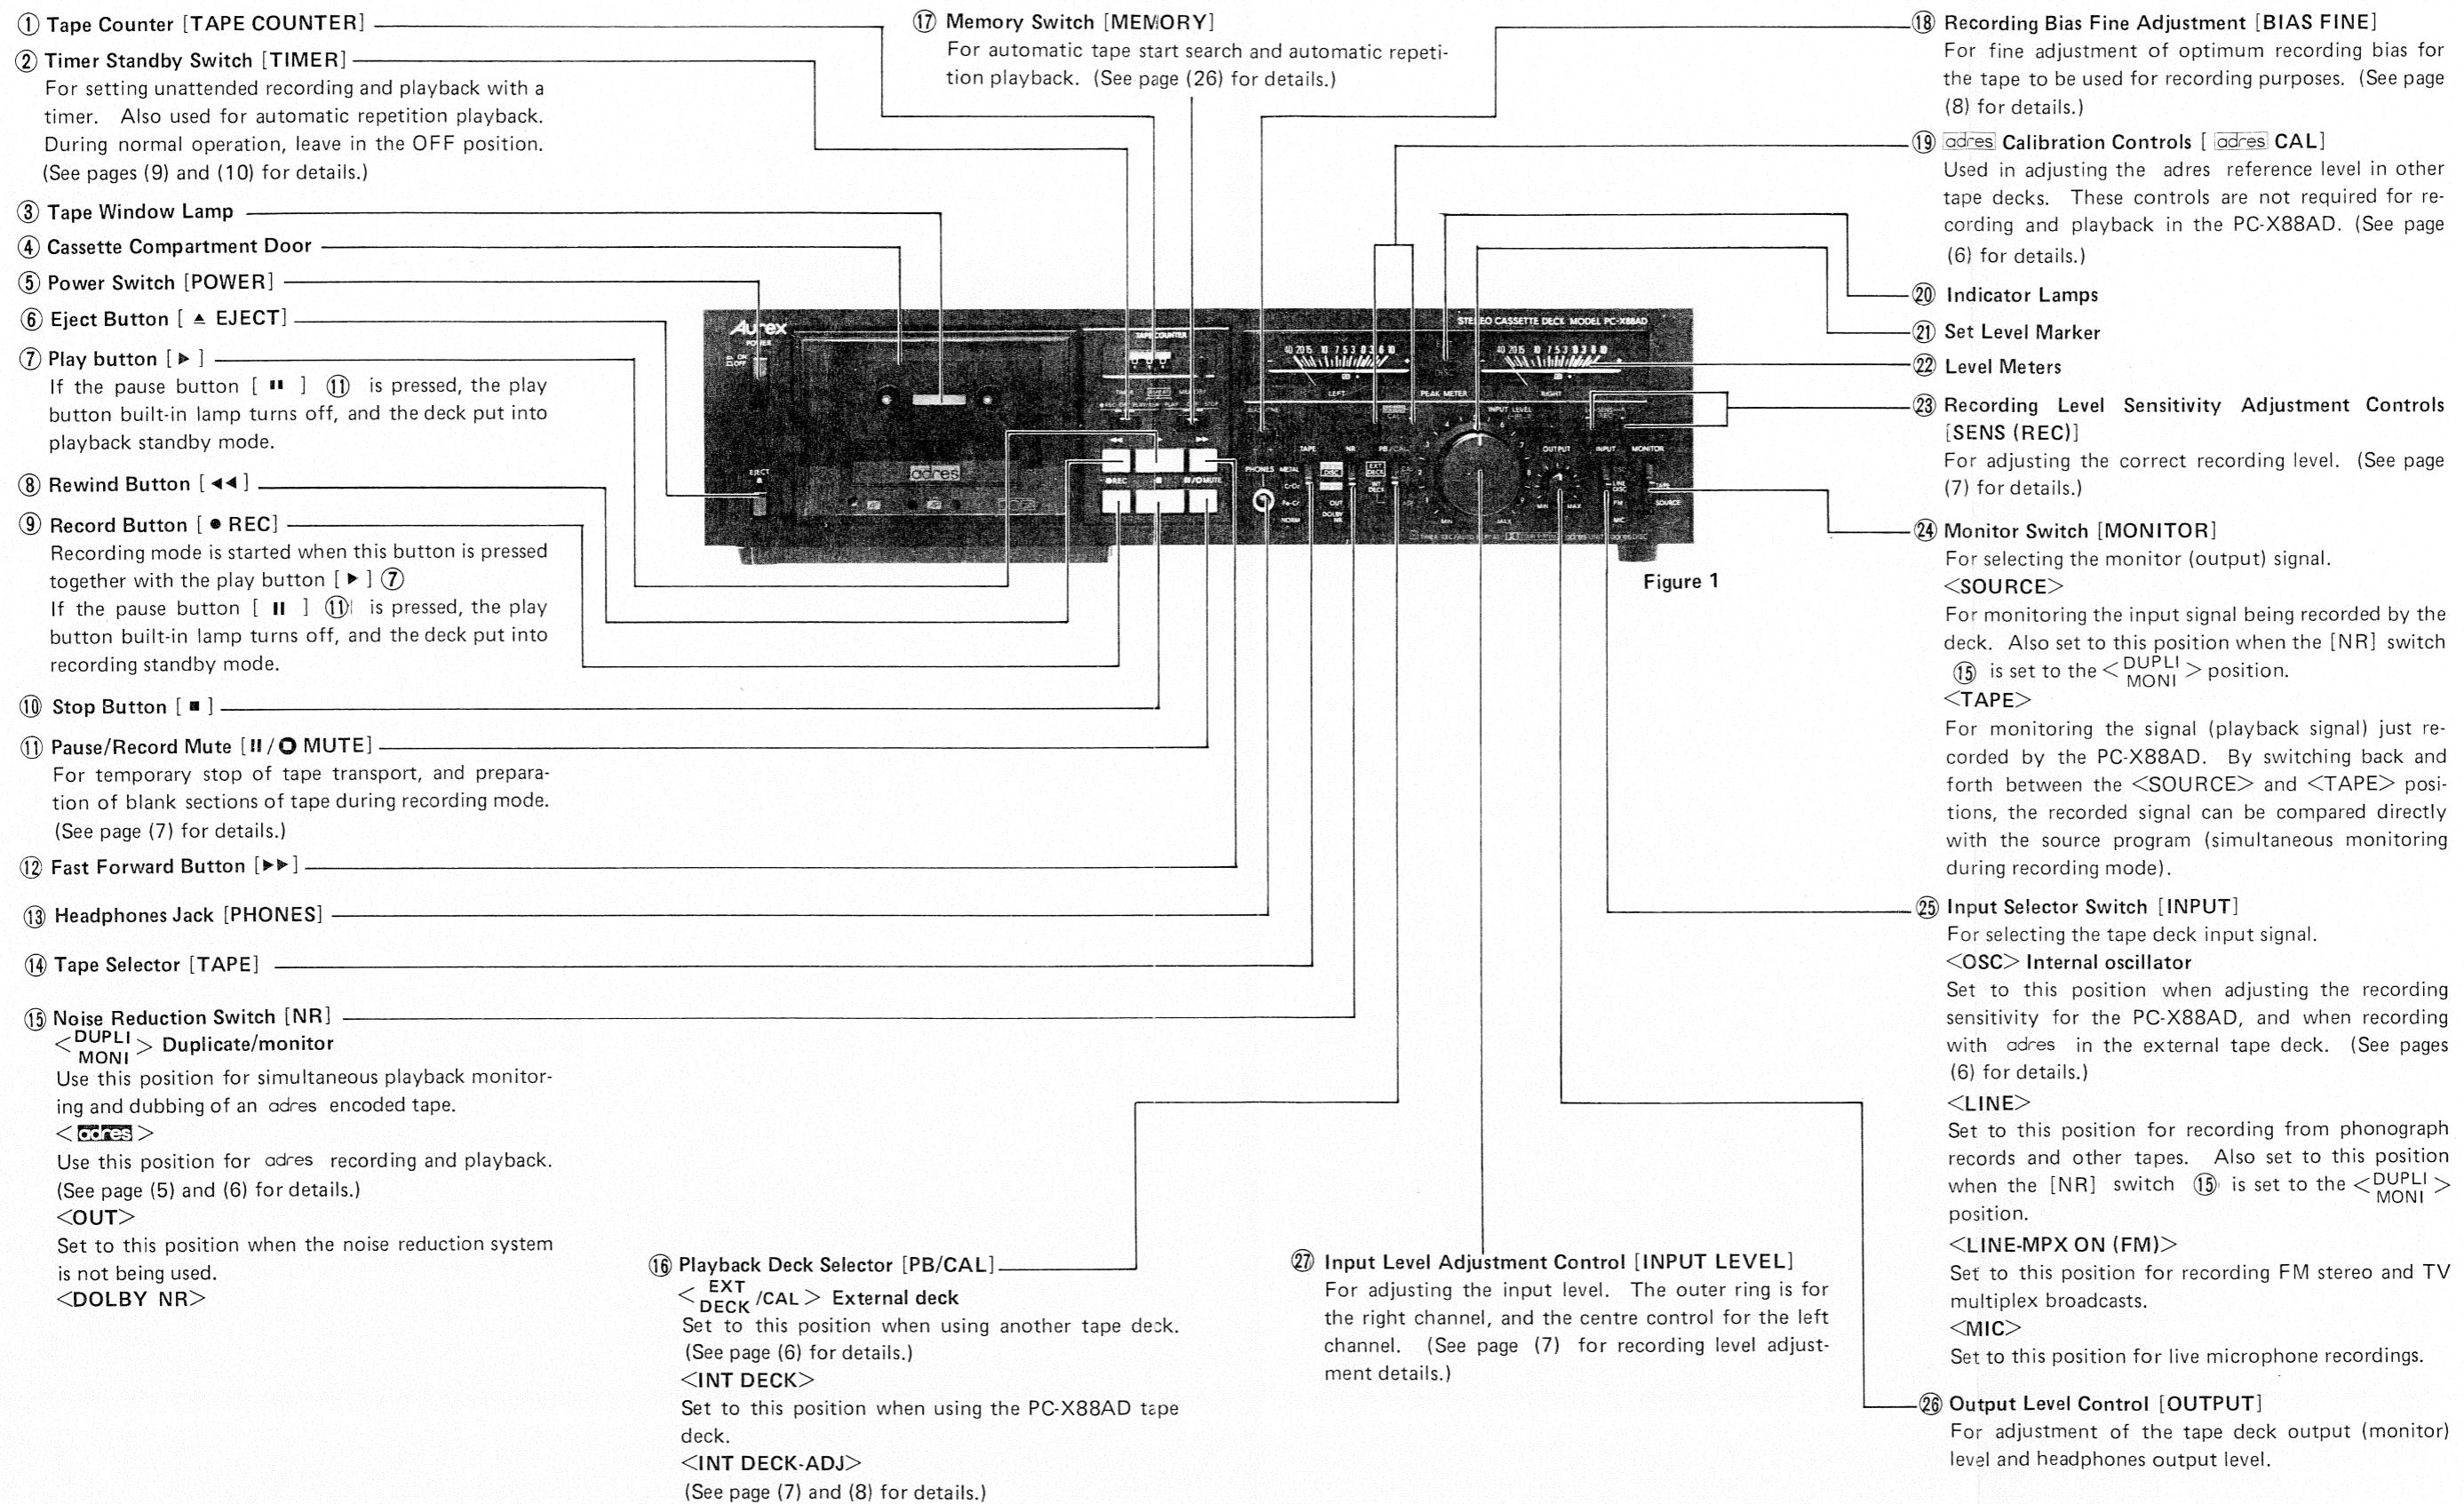

Figure 1

28 Microphone Jacks

When a single microphone is used, plug into the left channel jack for monaural recording.

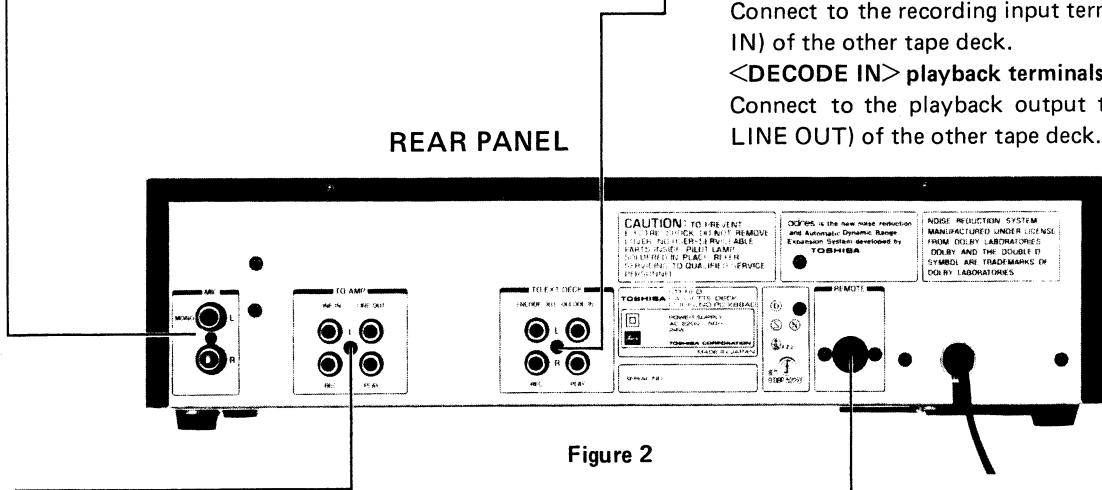

Figure 2

30 Amplifier Input and Output Terminals

<LINE IN> recording terminals

Connect to the tape playback input (REC OUT) terminals of your stereo amplifier.

<LINE OUT> playback terminals

Connect to the tape playback input (PLAY IN) terminals of your stereo amplifier.

29 External Tape Deck Input and Output Terminals

These terminals have been included to enable address recording and playback in another tape deck connected to the PC-X88AD.

<ENCODE OUT> recording terminals

Connect to the recording input terminals (REC/LINE IN) of the other tape deck.

<DECODE IN> playback terminals

Connect to the playback output terminals (PLAY/-LINE OUT) of the other tape deck.

System Connections

Connect the PC-X88AD into your audio system as shown in the following diagram using the pin-type cables provided. Make sure that each cable is connected to the correct terminal, and that all connections are made securely.

- Make sure that the power switches of all components are off before making any connections.
- Make doubly sure that there are no loose connections anywhere since these can easily give rise to unwanted noise.
- Use the red plug for the right channel.
- When connecting to the other tape deck, use the connecting cables supplied with that deck.

- ① Another tape deck (external deck)
- ② Connecting cable for recording (supplied with other tape deck, or purchased separately).
- ③ Connecting cable for playback (also supplied with other tape deck, or purchased separately).
- ④ Left channel microphone
- ⑤ Right channel microphone
- ⑥ Connecting cable for recording
- ⑦ Connecting cable for playback
- ⑧ Microphones (optional)
- ⑨ RM-15S (optional)

31 Remote Control Connector

When an optional remote control unit such as the RM-15S is plugged into this connector, the PC-X88AD may be controlled from the comfort of an armchair etc.

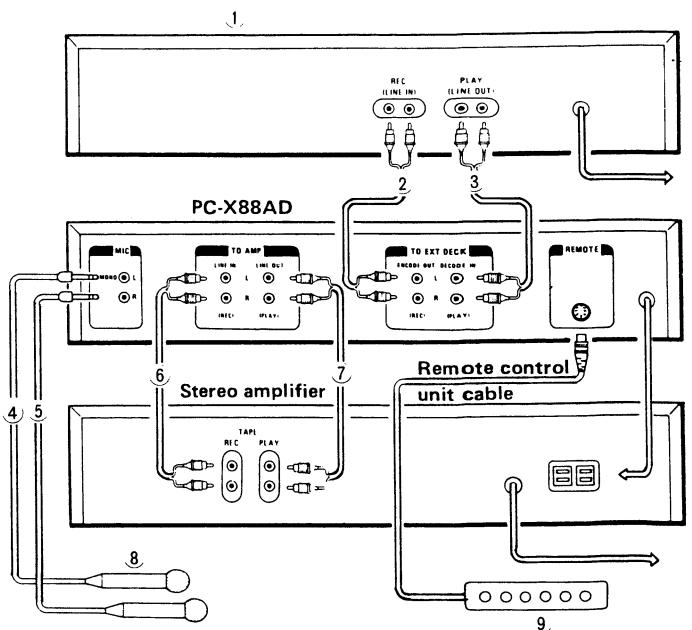

Figure 3

3. OPERATING INSTRUCTIONS

Operational Procedures

▪ Recording

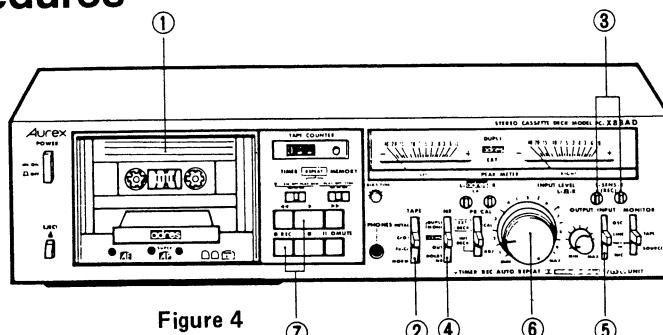

Figure 4

Note: Make sure that the timer standby switch [TIMER] is in the <OFF> position.

① Load a cassette tape into the cassette compartment.

Note: Make sure that the cassette tape is inserted properly.

② Switch the tape selector to the position designated for the type of tape being used.

③ Adjust the recording sensitivity. (See page 8 for details.)

Note: Recording bias fine adjustment is also described on page 8.

④ Set the [NR] switch to the desired position.

The <adres> position is recommended for high SN ratio recordings.

▪ Playback

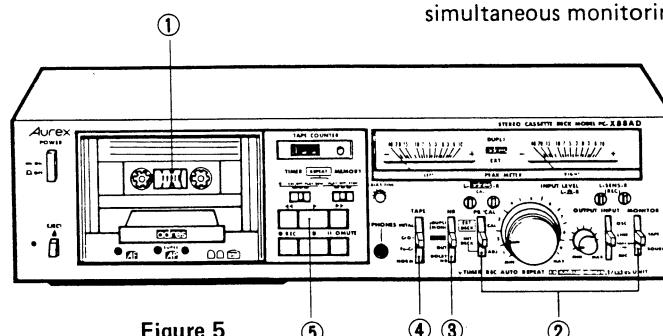

Figure 5

① Load the cassette tape.

Note: Make sure that the cassette tape is inserted properly.

② Set the playback deck selector to the <INT DECK> position, and the monitor switch to the <TAPE> position.

Note: For playback of tapes recorded with adres in another system, see page 7.

③ Set the [NR] switch to the position corresponding to the processing used in recording the tape.

④ Switch the tape selector to the position designated for the type of tape being used.

⑤ Press the play button [▶] to commence playback mode.

Note: Playback mode will not start if the input selector is in the <OSC> position.

▪ adres Recording and Playback in External Tape Deck

In adres recording and playback, a specific adres reference level (the **AD** level) is used. In tape decks with a built-in adres system, recording and playback levels are set automatically to this reference **AD** level. For recording and playback in the external tape deck, however, the recording and playback levels must be adjusted by the adres reference

signal (CAL TONE) beforehand to ensure compatibility between the PC-X88AD and the external tape deck. Therefore, proceed according to the following operation procedures for recording and playback in the external tape deck.

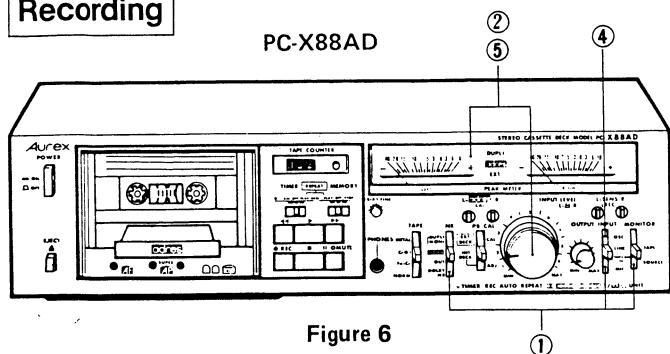

Recording

Figure 6

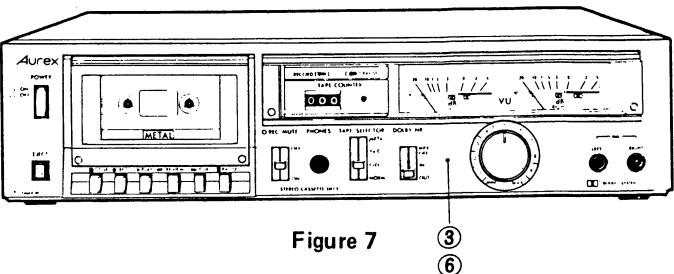

External tape deck

Figure 7

① Set the PC-X88AD input selector switch to the <OSC> position, the monitor switch to the <SOURCE> position, and the [NR] switch to the <~~adres~~> position.

② Adjust the input level of the adres reference signal (CAL TONE) generated in step ① above to -3 dB (AD level) by turning the input level adjustment control.

③ Put the external tape deck into recording mode, adjust the recording level to -3 dB (AD level), and record the CAL TONE at that level for about 20 seconds.

Note: The external deck NR switch should be in the OUT position.

④ Next set the PC-X88AD input selector switch to the recording source position.

⑤ Adjust to the optimum recording level for that source by turning the PC-X88AD input level adjustment control while watching the level meters.

⑥ Preparations are now complete. Commence recording in the external tape deck.

Note: Do not readjust the external deck recording level control after setting to the meter reading of -3 dB.

• The same program can also be recorded simultaneously in the PC-X88AD if so desired.

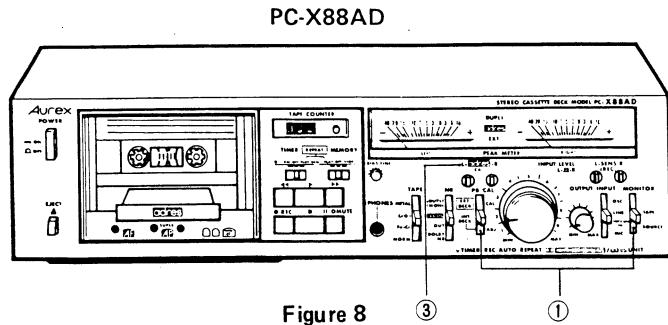

Playback

Figure 8

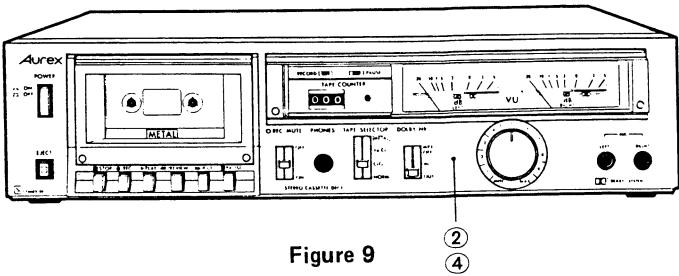

External tape deck

Figure 9

① Set the PC-X88AD playback deck selector to the <EXT DECK> position, and the monitor switch to the <TAPE> position.

② Play the CAL TONE section (recorded as described in the previous operation procedure) of the adres tape in the external tape deck.

Note: 1. Leave the external deck NR switch in the OUT position.

2. Leave the output control set to maximum position.

③ Adjust to -3 dB (AD level) with the PC-X88AD adres calibration controls [~~adres~~ CAL].

Note: Leave the [NR] switch in the <~~adres~~> position.

④ This completes the adjustment of the playback level. Put the external deck into playback mode.

Note: Playback mode will not start if the input selector is in the <OSC> position.

Note: 1. If an adres tape recorded in the external deck (cassette deck) is played back in the PC-X88AD, but the CAL TONE is not -3 dB (AD level), switch the playback deck selector to the <INT DECK-ADJ> position before starting in playback mode. In this case, the CAL TONE must be adjusted to -3 dB by the adres calibration control [~~adres~~ CAL].

2. For playback of adres-encoded tapes (recorded in the PC-X88AD) in the external tape deck, leave the CAL TONE at the -3 dB (AD level) position.

Recording and Playback in External Tape Deck without NR System

After setting the PC-X88AD [NR] switch to the <OUT> position, proceed in exactly the same way as described above for adres recording and playback.

Recording Level Adjustment

Generally, the type of tape used and the recording level setting will effect the recording frequency response. For example, the frequency response of metal tapes (particularly in middle and high frequency regions) is considerably better than normal tapes at the same level setting (see Fig. 10 below).

Furthermore, the recording/playback frequency response is also improved by setting the recording level at somewhat lower levels for the same tape (see Fig. 11).

If, however, the recording level is set too low, noise tends to become more prominent (i.e. SN ratio deteriorates). But since this deck incorporates the adres (Automatic Dynamic Range Expansion System), tape hiss is practically negligible. This means that recording levels in this tape deck can be set at lower values (particularly when recording program sources containing a large proportion of high frequency sounds) without noise becoming noticeable.

Hence, fine quality recordings with frequency response extending well into the high frequency region, and featuring a

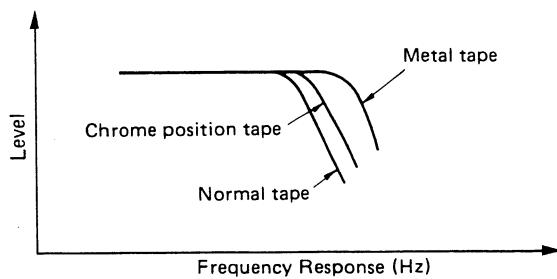

Figure 10

Mute Recording

The PAUSE/MUTE button therefore serves a dual purpose: record mute and pause.

For proper operation follow the steps given in the table just below:

- When the button is pressed during playback, only the pause function operates. The PAUSE/MUTE button is not effective in the fast-forward and rewind modes.

Playback of Tapes Recorded with adres in Another System

- Tapes recorded in other tape decks equipped with a built-in adres system may be played in the PC-X88AD.

Note: Set the playback deck selector to the <INT DECK> position.

- For playback of adres tapes recorded in another system including an adres unit, and including a recorded CAL TONE signal, proceed according to Note 1 in the **Playback** procedure described above.

very high SN ratio can be achieved. Note that by using lower recording levels, the resultant playback level will also be relatively low, but this may be readily compensated by re-adjustment of the amplifier volume control.

The peak level meters featured in this tape deck are extremely sensitive to large transient inputs (attack time of 10 ms). In comparison with normal VU meters, transient signals read 8 to 10 dB higher in this set, while continuous "average level" signals read about 4 or 5 dB higher.

Table 1 Maximum Settings of Recording Level

Type of tape	Maximum level meter readings
Normal tape	-6 to 0 dB
Chrome position tape	-3 to +3 dB
Metal tape	0 to +6 dB

* Lower level settings are recommended for program sources with greater high frequency sound content.

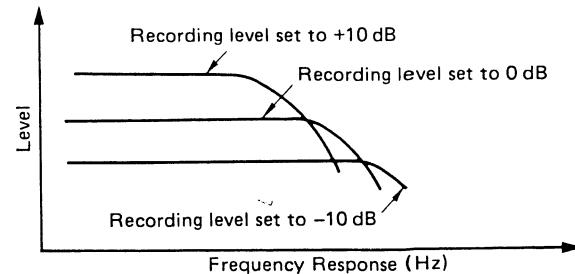

Figure 11

	① Making a non-recorded gap	② Releasing the pause mode
PAUSE/MUTE button operations	A non-recorded gap can be created by pressing and holding the PAUSE/MUTE button during recording. When the button is released, the tape stops in the pause mode. 	To restart recording, momentarily press the button again.
Tape transport and record mode	 Record mute starts. Non-recorded space Tape transport stops.	 Recording starts again.

Figure 12

Fine Adjustment of Recording Bias

Since the PC-X88AD tape selector switches the recording bias and equalization characteristics simultaneously for the type of tape used, fine adjustment of the recording bias is not normally required.

However, small differences in the optimum recording bias can result in changes in the frequency response and distortion level (see Figs. 13 and 14) with each separate tape used. In the PC-X88AD, the recording bias can be adjusted by the BIAS FINE control while monitoring during recording mode.

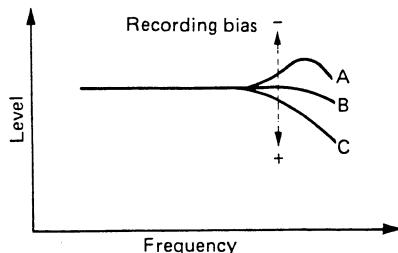

Figure 13

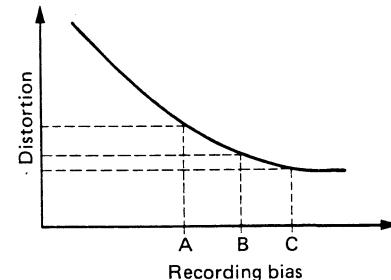

Figure 14

Recording Sensitivity Adjustments

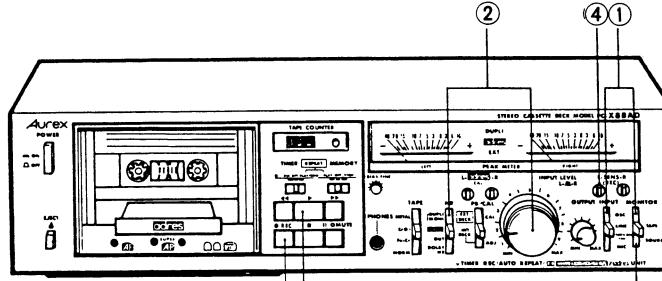

Figure 15

In general, the recording sensitivity differs slightly from tape to tape. The PC-X88AD is equipped with a built-in oscillator, and is capable of simultaneous monitoring during recording mode, thereby enabling recording sensitivity to be adjusted simply and accurately. Before commencing recording operations (as described on page 6), adjust the sensitivity as outlined in the following procedure.

- ① Set the input selector switch to the <OSC> position, and the monitor switch to the <SOURCE> position.
- ② By turning the input level adjustment control, adjust the level of the signal generated in step ① above to the reference levels listed in Table 2.

Table 2 Reference Levels

For adres recording	-3 dB (AD level)
For Dolby recording	+3 dB (Dolby level)
For recording at NR OUT position	0 dB

- ③ Commence in recording mode, and set the monitor switch to the <TAPE> position.

Note: Also set the tape selector to the position designated for the type of tape being used.

- ④ Adjust to the reference level by turning the recording level sensitivity adjustment controls [SENS (REC)].
- ⑤ This completes the recording sensitivity adjustment. Proceed with the recording as described on page 6.

Note: 1. The signal recorded during this operation may be erased once the adjustment has been completed.
2. Adjust sensitivity for each separate cassette tape used.
3. The tone generated in the <OSC> position cannot be monitored audibly.

Unattend Recording and Morning Alarm Playback (Timer Operations)

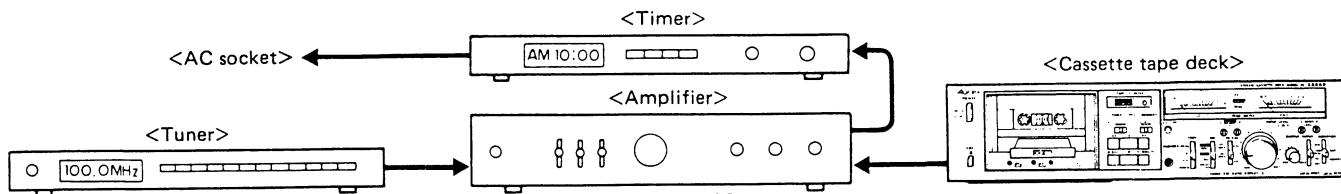

Figure 16

Note: The power switches for the amplifier, tuner and tape deck must all be left in the ON position.

■ Unattended Recording

① Setting the recording level

After first tuning to the desired radio broadcast (tuner operation), press the pause button [II] and then the record [**•REC**] and play [**►**] buttons. Then adjust the recording level with the [INPUT LEVEL] adjustment control.

② Set the recording start time in the timer unit (resulting in the audio system power being switched off).

③ Set the tape deck [TIMER] standby switch to the <REC> position.

This completes the setting procedure. The audio system will be turned on and the recording commence automatically at the time preset in the timer.

Note:

When the end of the tape is reached during this recording mode, the tape will be stopped automatically. The amplifier, tuner and tape deck power supply, however, will remain on. It is recommended, therefore, that a 2-step timer capable of switching the power off again be used. After completing the recording in this way, be sure to return the [TIMER] standby switch to the <OFF> position. Otherwise, there is danger of erasing wanted material when the tape deck is next turned on. It is a good idea to snap off the erasure prevention tabs along the back edge of the cassette after the recording has been completed.

■ Morning Alarm Playback

① Insert the tape you wish to use as the morning alarm. Put the deck into playback mode and adjust the amplifier volume control to a suitable level.

② Set the alarm time in the timer unit (resulting in the power supply being switched off).

③ Set the tape deck [TIMER] standby switch to the <PLAY> position.

This completes the morning alarm playback setting procedure. Playback will commence automatically at the time preset in the timer unit.

Note:

If the end of the tape is reached in this mode, the tape will be rewound and playback recommenced automatically.

If the morning alarm playback is no longer required, be sure to switch the power off, and return the [TIMER] standby switch to the <OFF> position.

Tape Dubbing

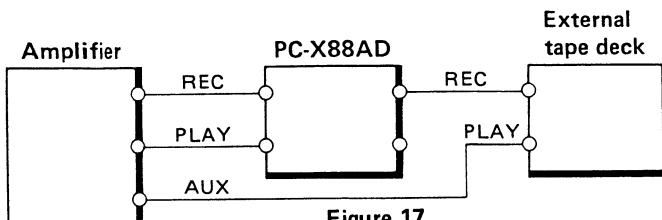

Figure 17

■ Connecting

Tape dubbing from one tape to another is possible if the external tape deck playback output connecting cable is connected to the AUX input terminals of the amplifier.

meter reads -3 dB (**AD** level).

Note: Leave the external deck NR switch in the OUT position.

■ While listening to an adres tape, another adres tape containing the same program contents can be recorded (in the external tape deck).

① Calibration procedure

1. If the tape to be copied includes a recording of the adres reference signal, play that CAL TONE in the external tape deck (with [OUTPUT] control in maximum position).
2. If the tape does not include the adres reference signal, record a signal in a blank section of tape from a test record cut at 1 kHz, 5 cm/sec. or tuner oscillator level in the external tape deck at an input level of -3 dB, and then play the signal back again with the [OUTPUT] control at maximum level.

Using the signal played back in the external deck, adjust the input level adjustment control so that the PC-X88AD level

2. Leave the external deck NR switch in the OUT position.

3. Record the playback signal in the PC-X88AD with the [NR] switch in the <DUPLI> position.

2. The calibration operation must always be completed before commencing tape dubbing in this case.

- Simultaneous monitoring of the recording is possible if the amplifier monitor switch is set to the TAPE position, and the PC-X88AD monitor switch is switched back and forth between the <TAPE> and <SOURCE> positions.

■ NR Recording of a Non-Encoded Tape

- ① Play the non-encoded tape in the external tape deck.
Note: Make sure that the amplifier FUNCTION selector is in the AUX position.
- ② Set the PC-X88AD [NR] switch to the desired noise reduction system, and proceed to record the playback signal.
Note: Set the input selector switch to the <LINE> position.

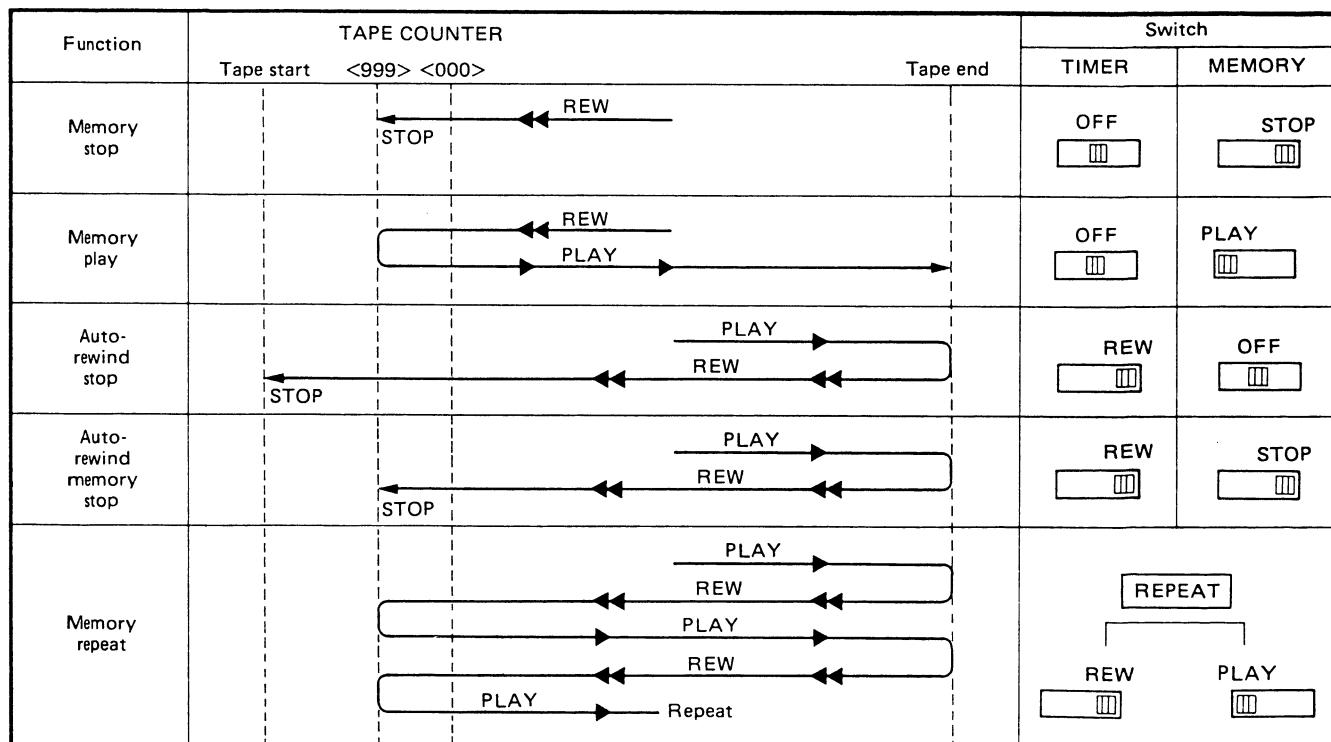

- The recording can be monitored during the dubbing process by switching the amplifier tape monitor switch to the TAPE position.

Note: Set the PC-X88AD monitor switch to the <TAPE> position.

Automatic Tape Start Search and Playback

Set the tape counter to <000> at the position where you wish the tape to start from again later on. When the tape is rewound afterwards, tape transport will stop automatically at <999>, and resume playback in repeat mode (if so set).

The [MEMORY] switch and [TIMER] switch may be used in combination in a number of ways for different automatic operational modes (see accompanying chart).

Major adres Features

- adres (Automatic Dynamic Range Expansion System) is a major breakthrough (successfully achieved by **TOSHIBA** engineers) in the elimination of hiss noise inherent to tape. (This noise is the result of the tape being narrow and moving slowly.)
- adres contains a variable emphasis circuit designed to vary the emphasis characteristics according to the input signal level. By compression before recording and expansion during playback of the signal right across the complete frequency spectrum, a clear, powerful playback signal may be obtained with a greatly expanded dynamic range and vastly improved SN ratio.
- Because of the effective value detector system in the adres level sensor circuit, there is practically no mis-matching due to differences in tape and tape deck characteristics. Furthermore, slight mismatching between input and output levels does not result in a significant change in sound quality.
- Furthermore, by keeping the compression/expansion ratio to a power of almost 1.5, and by incorporating the variable

emphasis circuit, there is very little "breathing" phenomenon. In other words, the adres system is the right type of noise reduction system for cassette tape decks.

Typical adres Results

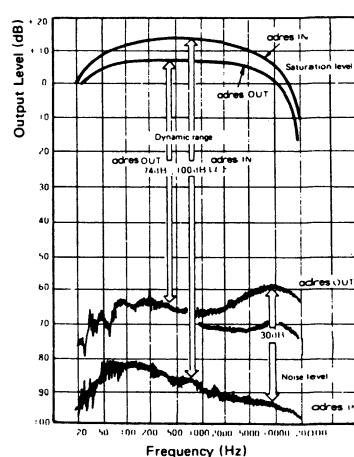

Figure 19

4. DISASSEMBLY INSTRUCTIONS

TOP COVER REMOVAL

1. Remove four screws (A) ($3\phi \times 8\text{mm}$) from each side of top cover and two screws (B) ($3\phi \times 8\text{mm}$) on jack board, then the top cover can be removed from the unit.

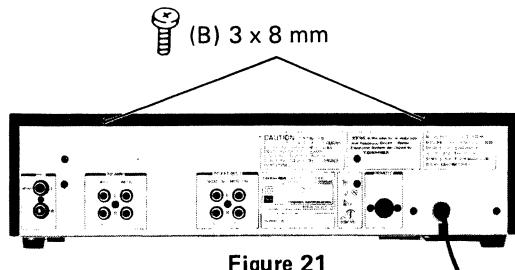

Figure 21

Figure 20

BOTTOM PLATE REMOVAL

1. Remove four screws (C) ($3\phi \times 8\text{mm}$), then the bottom plate can be removed out.
2. Then parts on main P.C. Board can be checked easily.

Figure 23

(D) Knobs

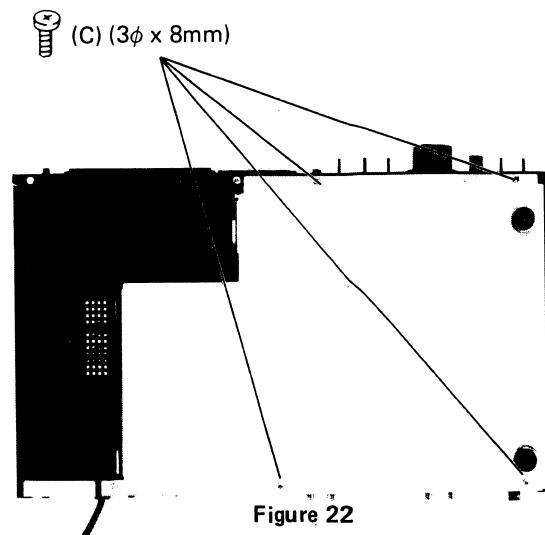

Figure 22

FRONT PANEL REMOVAL

1. Remove three knobs (D) on front panel and one hex. nut (E) holding the level marker under recording level control knob.
2. Remove four screws (F) ($3\phi \times 8\text{mm}$) holding the front panel and one screw (G) ($3\phi \times 8\text{mm}$) on the left side of the unit.

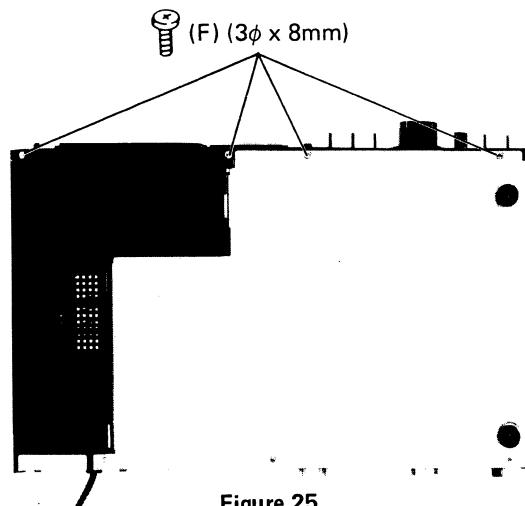

Figure 25

Figure 24

(E) Hex nut

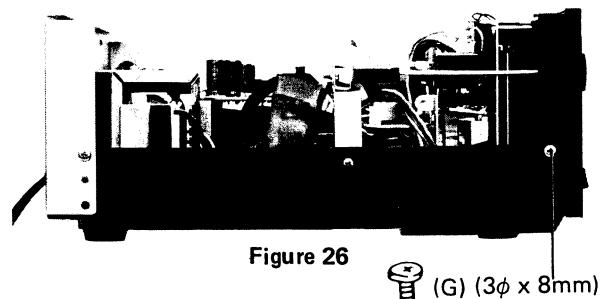

Figure 26

(G) (3φ x 8mm)

3. Disconnect six joint wires (H), 7p connector and 4p connector on P.C. Board, then panel assembly can be removed frontwards.
4. Remove two screws (I) holding Main P.C. Board, then remove meter P.C. Board and peak meter from the front panel.

CAUTION:
When disconnecting joint wires, confirm the position as it is.

5. Remove one screw (J) (3φ x 6mm) on the inside of the MIC jack from the main chassis, then the shield plate can be removed.
6. Disconnect two cord cramps (K) on Main P.C. Board to release the cords.

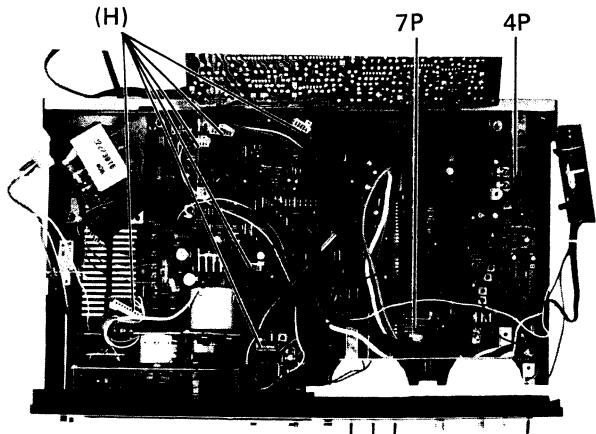

Figure 27

ADRES P.C. BOARD AND MUTING P.C. BOARD REMOVAL

1. Remove two screws (L) (3φ x 8mm) holding ADRES P.C. Board.
2. Remove two screws (M) (3φ x 8mm) holding Muting P.C. Board.

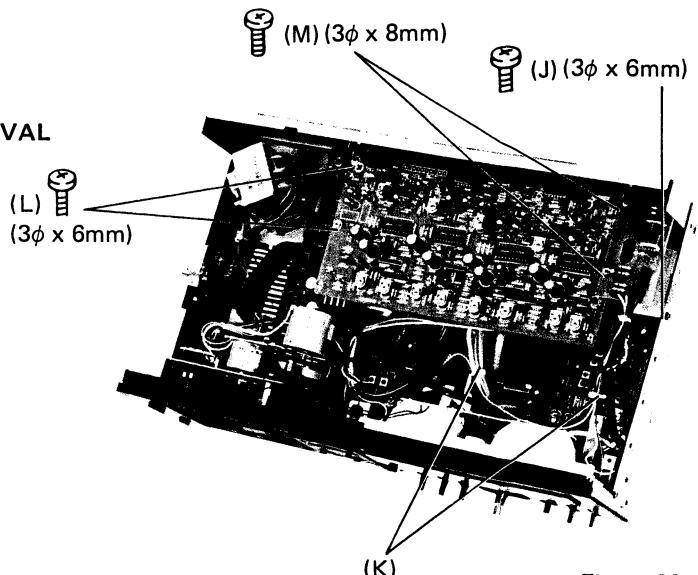

Figure 28

MECHANISM ASSEMBLY REMOVAL

1. Remove the front panel (Refer to front panel removal).
2. Remove three red screws (N) (3φ x 8mm) holding mechanism ass'y and one red screw (O) (3φ x 8mm) holding cord clamp.

CAUTION:

When removing Mechanism Ass'y from the front panel, confirm the installation position of counter belt.

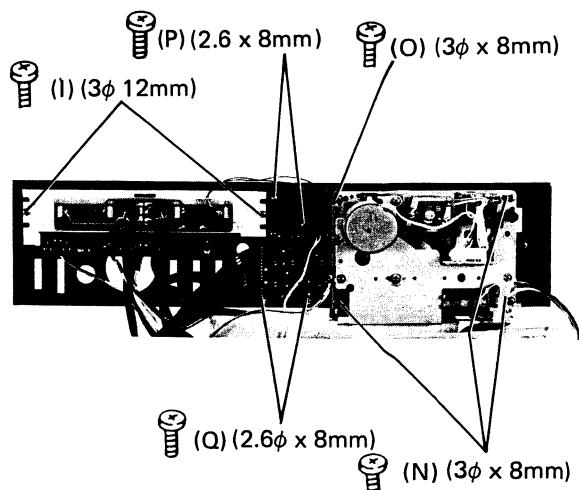

Figure 29

KEY SWITCH REMOVAL

1. Remove two screws (Q) (2.6φ x 8mm) holding key switch P.C. Board, then key switch and L.E.D. holder can be removed from the front panel.

5. TECHNICAL POINTS

Technical Points (Heads, Solenoid, Motor)

- Three head system shows the following improved characteristics and high performance mechanism as compared to conventional ones. When replacing and adjusting tape mechanisms, refer to the following instructions.

Record/Playback Combination Head

- A record head and a playback head are independently combined.
- Such a new head requires correct adjustment of head height and head pressure. Therefore, a new adjustment mechanism of head pressure is adopted.
- A head azimuth adjustment screw and a tape guide are located in the opposite side as compare with usual position and the P.C. Board is installed behind the head.

Erase Head

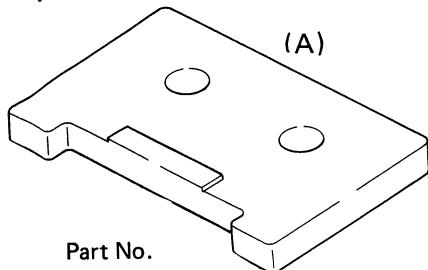

- In order to give a suitable tape tension to R/P combination head, the erase head has a movable mechanism as to press the tape between the fixed pin with felt pad and the erase head. Therefore, the erase head replacement must be carefully done.

Capstan & Pinch Roller

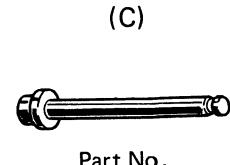

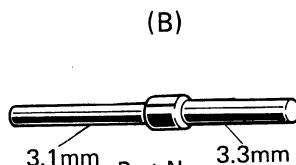

- The tape running part of the capstan shaft has been treated with special chemicals to give a tape driving force to it and also the tape running part of the pinch roller has a larger round than the other same series models (PC-X45AD, PC-X44AD). When replacing them, be sure to use the specified ones.

Mechanical Adjustment Point (Head, Solenoid, Motor)

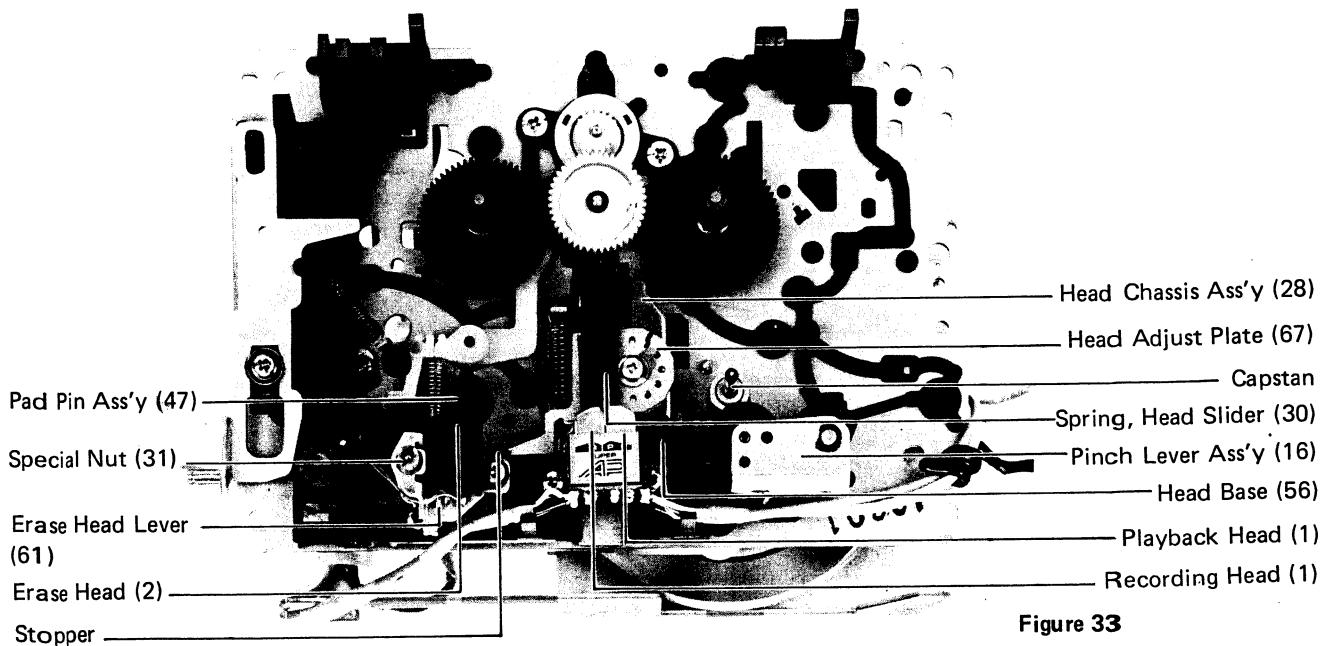

1. Adjustment Tools Required

Part No.
25740116

2. Part Names Around the Heads

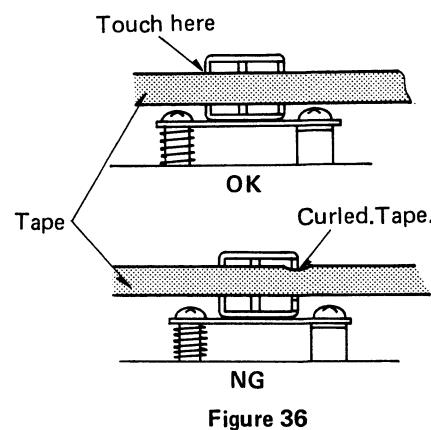

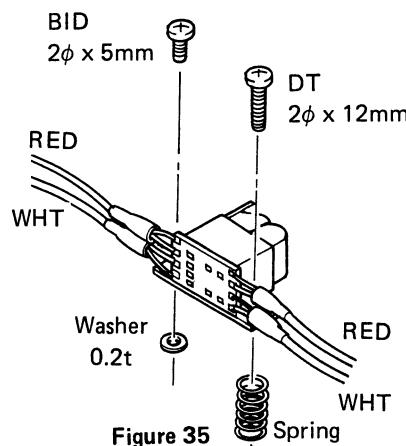

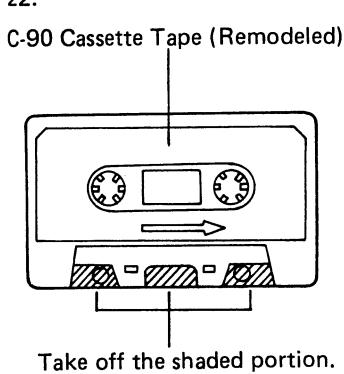

3. Replacement & Adjustment of R/P Combination Head

- Disconnect four head lead wires (single cored shield wire) and remove two head installation screws (BID 2φ x 5mm/ DT BID 2φ x 12mm).
- Replace the R/P head.
- Reassemble the head installation screws and the head lead wires.
- Confirm the head height as follows.

Set the Head azimuth adjustment screw so that the head becomes horizontal by measuring with the eyes and confirm that the mirror cassette (MC-09C) or C-90 cassette (cut off the shaded portions to remodel as shown in figure 34) is not curled on play mode. If the tape is curled in the upper side of tape guide, add a washer (0.2t) under the R/P head and if it curled in the lower side of tape guide, remove the washer (0.2t) under the R/P head as shown in figure 35.

- Adjust head azimuth according to the item "Head Azimuth Adjustment in Electrical Adjustment Table" in page 22.

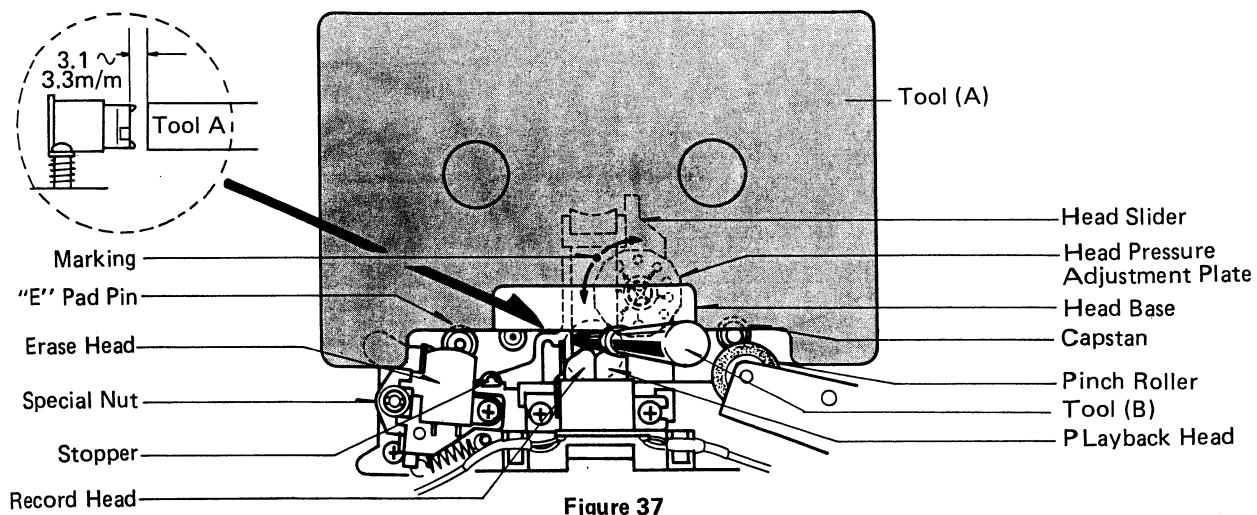

(f) Head Pressure Adjustment

Set the specified adjustment tool (A) as shown in figure 30, then check the gap between the adjustment tool (A) and the tip of R/P head by inserting the adjustment tool (B). Accordingly check that the thinner half of the tool (B) passes smoothly through the gap and the thicker half does not go through.

- When the head pressure is beyond the specifications above, loosen the screw on the head pressure adjustment plate and lift it upward a little. Then the head pressure can be changed by turning the plate to the right or left.
- The mark number "4" is the basis of the adjusting plate.
- When turning the plate clockwise, the head pressure will become weaker slightly. (4) → (5) → (6)
- When turning it counter-clockwise, the head pressure will become stronger. (4) → (3) → (2) → (1)

CAUTION: Improper adjustment of (d), (e) and (f) doesn't get the optimum result on such as frequency response, level deviation and wow/flutter. When using the adjustment tools, take care not to damage the R/P head.

4. Replacement and Adjustment of Erase Head

Disassembly

(a) Disconnect the lead wires from the head terminal. Take off the solder of the lead wire on P.C. Board.

CAUTION:

- The lead wires are stuck to the erase lever.
- Do not give a strong force to the lead wires since they are thin.
- Distinction between (+) and (-) wires is not necessary.

(b) Remove the spring (7).

CAUTION: This spring is for the erase head to press the erase head pad properly, so unspecified parts must not be used.

(c) Remove the special nut (1).

CAUTION: The special nut is fixed with a screw lock paint, so it can be removed with a (-) driver by heating and moving it a little.

(d) Remove the erase head from the shaft.

CAUTION: Do not lose the two washers (2, 3).

(e) Remove the two screws ((5) DT 2φ x 8mm/(8) BID 2φ x 3mm).

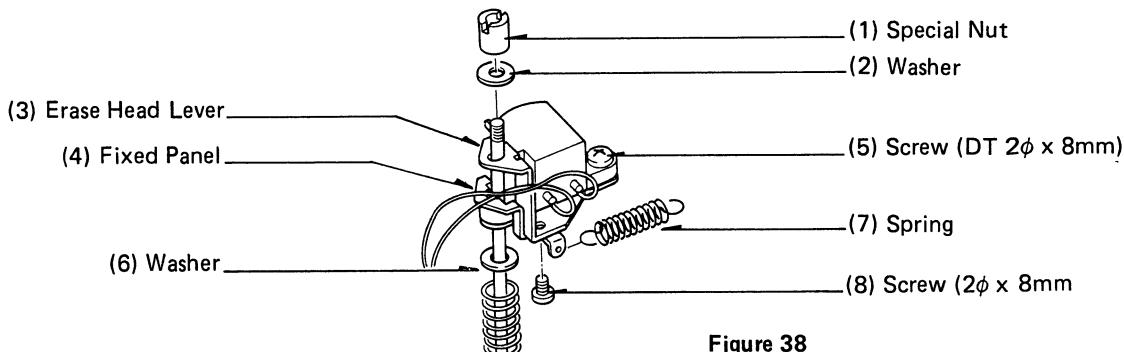

Figure 38

Reassembly

(f) Set the adjustment tool (C) as shown in figure 32.

CAUTION: The erase head's hole and the erase lead lever's hole should be located in a concentric position, otherwise the erase head does not work smoothly.

(g) Fix the two screws temporarily, as explained at (e).

CAUTION: When setting the screw (DT 2φ x 8mm), adjust the slip between the screws and the erase head's hole, as shown in figure 40.

(h) Fix the screws properly, then take care of adjusting tool (C).

(i) Since the erase head and the screw (BID 2φ x 3mm) or the erase head lever are close together, check if they are not contacted. If there is no space between them, bend the erase head terminal a little upward.

CAUTION: If the erase head terminal contacts with the erase head lever, it may cause "no erasing" or "overheat and damage of OSC coil". Be careful not to contact them when soldering the lead wires.

(j) Get the erase head assembly through the shaft together with a washer.

(k) Install the spring (7).

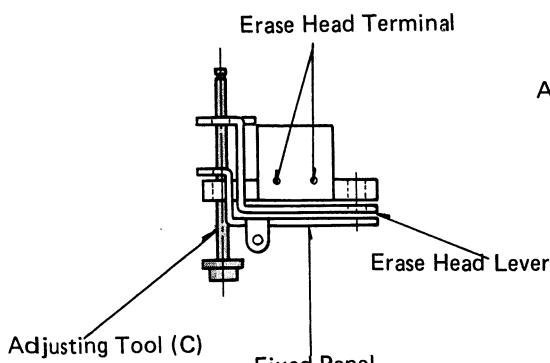

Figure 39

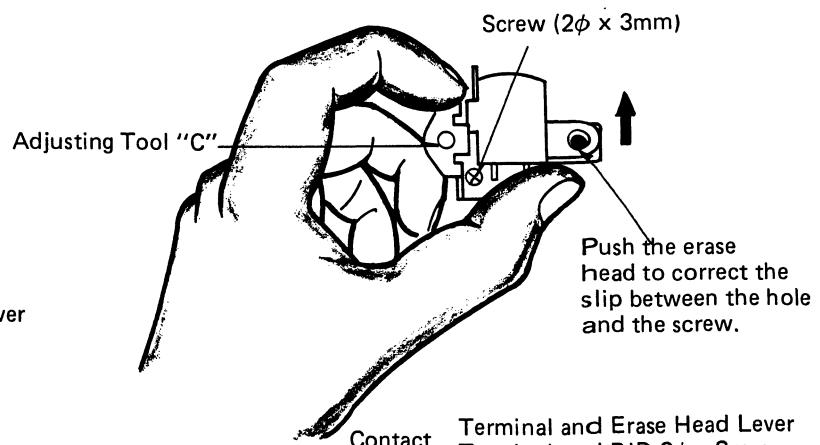

Figure 40

- (l) Fix the special nut (1), Tighten and adjust roughly until the top of the shaft becomes same level with the groove of the nut as shown in figure 41.
- (m) Solder the removed lead wires to the erase head terminals and the relay P.C. Baord.
- (n) Confirm that there is a suitable clearance between the erase head level and the head base stopper in play mode as shown in figure 43.

CAUTION: This clearance depends on the setting of R/P combination head pressure and when replacing the R/P head, confirm the clearance after adjusting head pressure.

- (o) Erase head height adjustment

After rough adjustment of the above item "l", confirm that the mirrow cassette tape (MC-09C) does not curl in play mode. If it curls, adjust the erase head height by turning the special nut.

- (p) Apply some lock-paint between the special nut and the shaft.

CAUTION: • Painting can be done easily by applying some lock-paint on a thin bar such as a match bar. Be careful to keep the lock-paint away from other parts.
 • If the play and stop modes are repeated to change before the lock-paint hardens, the special nut turns and consequently the erase head adjustment becomes wrong.
 • Care must be taken so that the screw lock-paint does not stick to the rotating part of erase head.

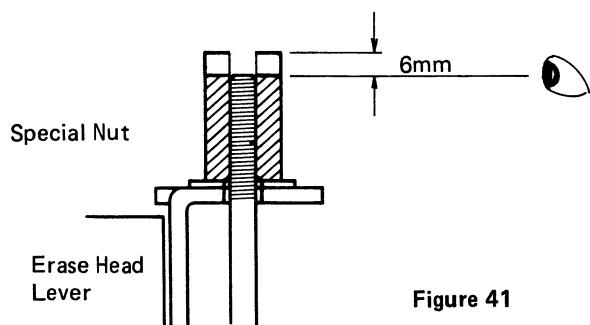

Figure 41

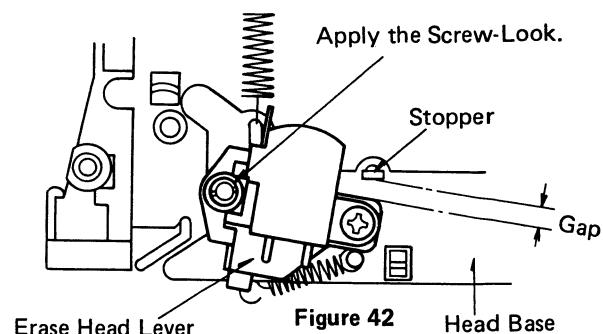

Figure 42

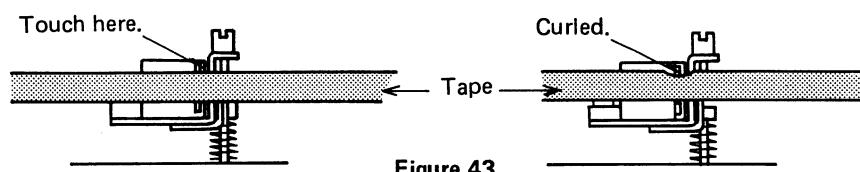

Figure 43

5 Replacement of Erase Head Pad

- Remove the screw (BID 2φ x 5mm) by inserting a screwdriver through the hole of the thrust plate on the rear side of deck mechanism, and the erase head pin can be taken off to the front.
- Prepare a new pad with a double face adhesive tape, and stick it strongly (about 1 kg pressure) on the side cleaned with benzine.
- Be careful not to touch the sticky part of the tape by fingers.

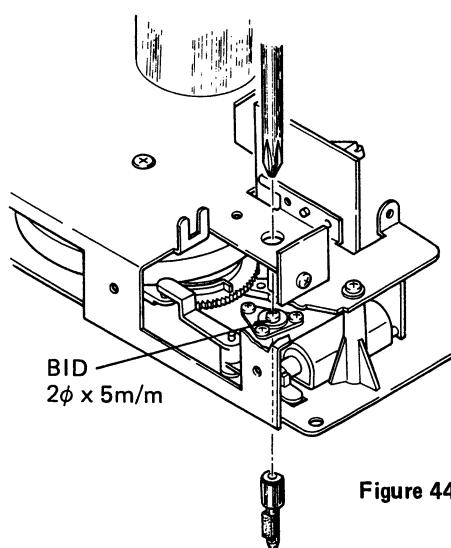

Figure 44

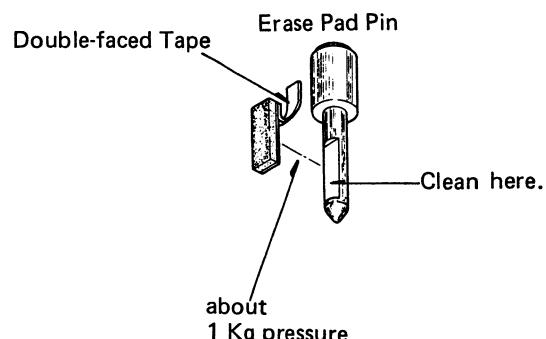

Figure 45

6. Replacement & Adjustment of Reel Motor

- After removing the P.C. Board from the rear of the reel motor, remove two screws (BID 2φ x 8mm) and take off the motor.
- When installing the new motor, be careful of the position of the marked hole (3.5φ) on the reel motor as shown in Figure 46.
- After installing the motor, apply some grease (GB-TS-1) on the take-up gear.
- After replacing the motor, set the torque cassette to check the take-up torque (specified value: 40 g/cm ±10 g/cm).
- If the above value is out of specified one because of variety of motor, adjust the semi-fixed variable resistor (R747 in the schematic diagram) on R/P P.C. Board.

Caution: The needle of torque meter indicates ±5 g/cm fluctuations because of characteristics of this motor. In this case, read a mean value on the meter.

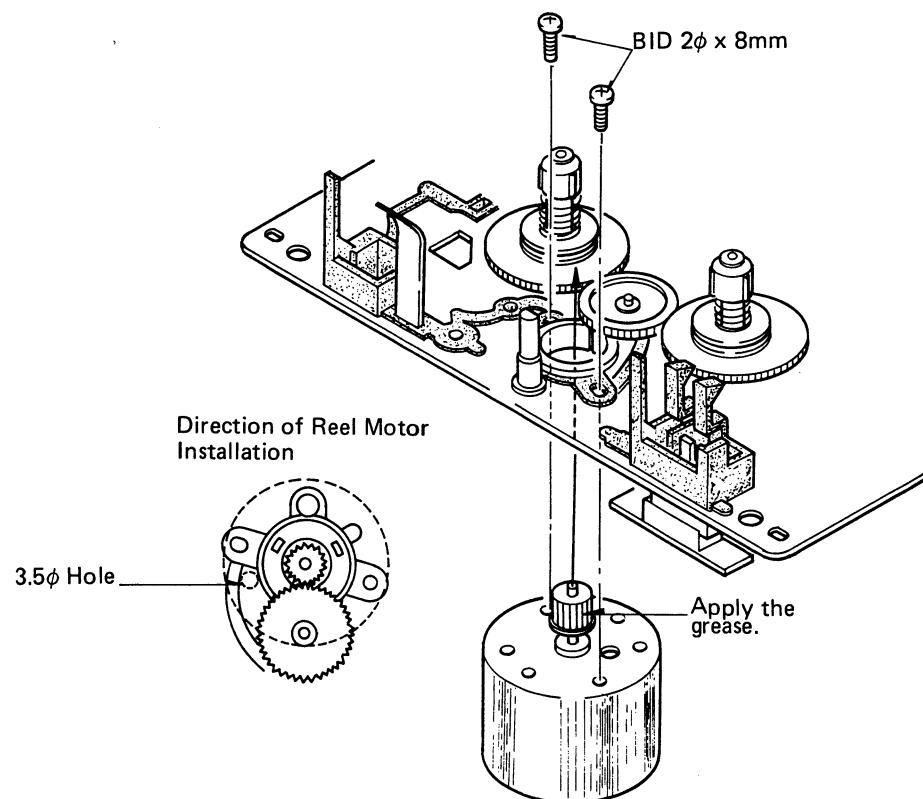

Figure 46

7. Replacement of Main Motor

- (a) After removal of the mechanism assembly according to the item "MECHANISM ASSEMBLY REMOVAL", remove four screws ($3\phi \times 6\text{mm}$, $2\phi \times 8\text{mm}$), a spring and cord cramps as shown in figure 47, and then take off the belt between the main motor and the flywheel.
- (b) Turn the mechanism assembly reversely and remove three screws ($2.6\phi \times 8\text{mm}$) together with three motor cushions and one screw ($3\phi \times 4\text{mm}$) as shown in figure 48, and then the main motor can be removed from the main chassis.

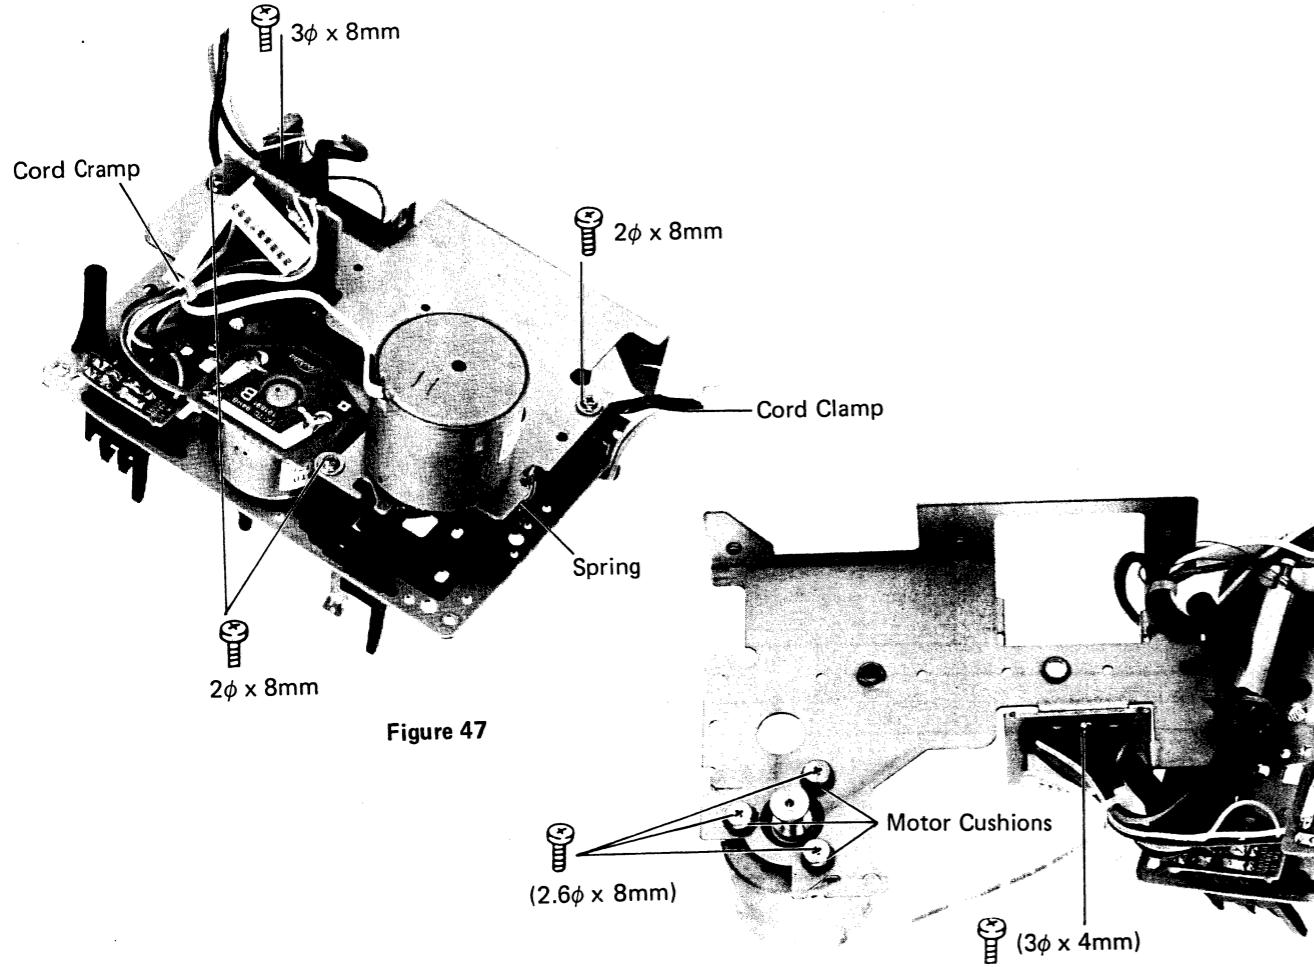

Figure 47

Figure 48

8. Replacement & Adjustment of Solenoid

- (a) Take off the solder from the solenoid terminal and remove the P.C. Board.
- (b) Remove two screws (BID 2.6 x 3.5, BID 2.6 x 4) holding the solenoid.

CAUTION:

- The tips of screws appear by shifting the lock slider (D) lightly to the left (toward outside) when removing the screws.
- These screws can be removed with a clock screwdriver or thin driver. If such drivers are unavailable remove the eject lever and lock slider (D).

- (c) Replace the solenoid to new one.

CAUTION: When reassembling, use the specified screws. Longer screws touch the coils in the solenoid and as a result, it brings a rare shorting of them. It may happen to cause not only the solenoid disorder but also a fire and a burning because of overheating of ground spring.

(d) Adjustment of Installation Position

The solenoid assembly can be moved a little forward or backward by holding the tip of solenoid pin and the rear side of it in current penetrating state.

In this state, set the clearance 0.1 to 0.5 mm between the 3ϕ tip of solenoid lever and the square hole of mechanism chassis as shown in figure 49.

- If the fingers do not touch the tip of the solenoid pin but the solenoid lever, the exact adjustment cannot be done because the state becomes like that when the lever is more moved than when the electric is going through the solenoid.
- If there is no space described above, the solenoid cannot be fully pulled when the electric is going through, does not maintain the play mode when changing from the stop mode, and the head slider goes back easily.

(e) Confirm that the operation of the solenoid lever and the head slider is normal after repeating to change the modes from stop to play with the electric current going through.
